#### Introduction

This year's Vital Statistics Report shows that health in Philadelphia continues to improve, with consistent decreases in mortality from most causes of death and years of potential life lost to age 75. Further, in 2014 we saw a decrease in the disparities in life expectancy between black and white men.

#### Major findings of the 2014 Vital Statistics Report

- Life expectancy at birth was 73.0 years for men and 79.6 years for women, representing a decrease of 0.2 years for men and an increase of 0.3 years for women.
- Life expectancy at birth was lowest among non-Hispanic black men at 70.2 years in 2014, about the same as in 2013.
- Disparities in life expectancy between non-Hispanic blacks and non-Hispanic whites decreased by 28% for men and 34% for women between 2010 and 2014.
- The infant mortality rate of deaths per 1,000 live births decreased 4.9%, from 8.2 in 2013 to 7.8 in 2014, the lowest since 1960. However this remains substantially higher than the US rate of 5.82 in 2014.
- Heart disease remains the leading cause of death in Philadelphia.
- Death rates for all causes continue to decline except for accidents (unintentional injuries),
  which includes drug overdoses. In general, death rates for most causes of death remain higher
  among non-Hispanic blacks than other racial and ethnic groups within the city. The exceptions
  are accidents (unintentional injuries) and suicides, for which death rates are highest among
  non-Hispanic whites.
- Deaths due to smoking (3,721) constituted 28% of all deaths in the city, similar in 2013.
- Among teenagers and young adults, close to one-third of all deaths were attributable to alcohol use.
- Teen birth rates continue to decline, with an overall 31% decline since 2010 and decreases among all racial and ethnic groups.

### **Historical Changes in Reporting Procedures**

Beginning with the 2008 Vital Statistics report, PDPH began to provide findings for the entire population and by the race/ethnicity groups of non-Hispanic white, non-Hispanic black, non-Hispanic Asian, and Hispanic, based on the 31 race and ethnicity categories made available in the 2000 decennial census. Reporting by race and by ethnicity separately was dropped.

Beginning in 2005, the annual Vital Statistics report no longer included disease morbidity reporting. Morbidity reports for infectious, chronic, and environmental conditions can be found at <a href="http://www.phila.gov/health/Commissioner/Reports.html">http://www.phila.gov/health/Commissioner/Reports.html</a>.

Supplemental data tables detailing vital events by zip code and census tract will also be made available on the Department's website at:

http://www.phila.gov/health/Commissioner/DataResearch.html.

The birth and death data used to create this report were obtained from electronic files provided by the Pennsylvania Department of Health, which requires that the following statement be included: "These data were supplied by the Bureau of Health Statistics and Research, Pennsylvania Department of Health, Harrisburg, Pennsylvania. The Pennsylvania Department of Health specifically disclaims responsibility for any analyses, interpretations or conclusions."

# **Population Findings**

### **Population Summary**

This section contains population analyses for 2000 through 2014. Multiple population estimates were used depending on the analysis, including the Census Bureau's population count conducted every 10 years (decennial enumeration) and its annual population estimates for July of each year. Details can be found in the Technical Appendix.

The 2014 population of Philadelphia was estimated as 1,561,562 (Table P1). This represents a 2.3% increase from the 2010 enumerated population and a 2.9% increase from the 2000 enumerated population. From 1960 to 2010, the population of Philadelphia decreased by 24% from approximately 2 million to 1.5 million.

In 2014, there were 647,477 black non-Hispanics in Philadelphia, making up 41% of the total population (Table P2). For white non-Hispanics, Hispanics, and Asian non-Hispanics, the values were 557,212 (36%), 213,487 (14%) and 110,017 (7%), respectively. People between the ages of 20 and 34 represented a larger proportion of the population among white non-Hispanics and Asian non-Hispanics than among black non-Hispanics and Hispanics (Figure P4). Among 0-4 year-olds, 22% are Hispanic and 43% are non-Hispanic black (Table P2).

Between 2000 and 2014, population growth was seen in the group 45-64 years of age, while declines were seen in the groups 5-14 and 65 and older (Figure P5A). In terms of changes by race/ethnicity, between 2000 and 2014, the fastest growing groups were Hispanics (an increase of approximately 85,000) and non-Hispanic Asians (an increase of approximately 42,000) (Figure P5B). White non-Hispanics decreased by 89,000. The non-Hispanic black group has remained virtually unchanged.

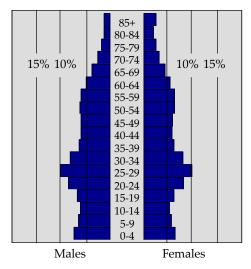

Analyses of the population by planning districts (Table P3, Maps P1, and P2) demonstrate significant clustering by race-ethnicity. Non-Hispanic whites comprise large portions of the population in Northeast and South Philadelphia. Non-Hispanic blacks comprise large portions in West and North Philadelphia; Hispanics in North and Lower Northeast Philadelphia. Asians are most prevalent in South, Central, and Lower Northeast Philadelphia.

2014 Vital Statistics Report

City of Philadelphia Department of Public Health

Page 23 of 221

# **Natality Findings**

#### **Natality Summary**

All natality statistics are derived from the live birth certificate records, which are electronically reported to the Pennsylvania Department of Health. The denominator to calculate the percentages of the natality indicator, except country of origin, is total live births which do not include the births missing information on the corresponding indicator.

#### Births and Birth Rates

In 2014, there were 22,372 live births to women living in Philadelphia (Table N1A). The crude birth rate was 14.3 per 1,000 residents in 2014. Hispanic women had the highest birth rate, at 18.5. Among non-Hispanic white and Asian women, the highest birth rate was among 30 - 34 year old, among non-Hispanic black the highest birth rate was among 25 - 29 years old, and among Hispanic women the highest birth rate was among 20 - 24 year old.

Among non-Hispanic white and black women, birth rates were relatively flat between 2005 and 2014. Birth rates among Hispanic women decreased slightly over the same time period, while birth rates among non-Hispanic Asian women have varied.

Over the last 50 plus years, the crude birth rate dropped from 21.9 births per 1,000 persons in 1960 to 14.2 in 2001; increased to 15.8 in 2007 and 2008; and then decreased again to 14.3 in 2014 (Table N1B).

#### **Births to Teens**

The rate of births to teens 15-19 years of age hovered just under 60 births per 1,000 girls 15-19 between 2005 and 2008. It has decreased steadily every year since, falling to 34.9 in 2014 (Table N3).

In 2014, the highest rate of births to teens was among Hispanics. From 2005 to 2014, the rate of births among Hispanic teens declined about 43% from 103.0 births per 1,000 to 58.9 births per 1,000 (Table N3).

#### Country of Origin

In 2007, we began reporting on the country of origin of women who gave birth in Philadelphia (Table N4). In 2014, 19.3% of women who gave birth were born outside of the United States (an additional 1.6% of women did not provide a country of origin): 388 women who gave birth were born in the Dominican Republic, 362 were born in China, and 228 were born in Mexico. These were the 3 most common countries of origin, outside of the United States.

#### Low Birth Weight

Babies weighing < 2,500 grams at the time of birth are considered to be of low birth weight. In 2014, 10.7% of all live births were of low birth weight (Table N5A). The racial/ethnic group with the highest rate of low birth weight in 2014 was non-Hispanic black women; 13.6% of their babies were of low birth weight. Overall, the percent of low birth weight births has fluctuated between 10% and 12% since 1960. In the last decade, the highest rate of low birth weight was 11.8% in 2007, and the lowest rate was 10.4% in 2012.

Babies weighing < 1,500 grams at the time of birth are considered to be of very low birth weight. In 2014, 2.1% of all live births were of very low birth weight (Table 5NC). As with low birth weight, the racial/ethnic group with the highest rate of very low birth weight in 2014 was non-Hispanic black women; 3.1% of their babies were of very low birth weight. Overall, the percent of very low birth weight births remained stable from 2005 to 2014 at around 2.5%.

#### Gestational Age

Gestational age at birth is measured by the number of completed weeks of pregnancy. Preterm births are defined as births with less than 37 completed weeks of gestation. Term births are births with 37 to 41 weeks of completed gestation. Births with 42 or more weeks of completed gestation are post-term births.

In 2014, 10.7% of births were preterm (Table N6A). The highest rate of preterm births was among non-Hispanic black women, with 12.7% of their babies being born preterm. Overall, the percentage of preterm births remained relatively stable from 2005 to 2014 at between 10.7% and 12.9%.

#### Delivery, Maternal, and Neonatal Outcomes

Detailed data on complications of labor and delivery and neonatal morbidity can be found in the body of this report. The following are highlights drawn from these statistics.

There was a general increase in Cesarean section deliveries between 2005 and 2009, but the prevalence has plateaued. In 2014, 30.2% of births were delivered via Cesarean section (Table N9A). Among women who were obese prior to pregnancy, 40.6% of births were via Cesarean section (Table N9C).

#### Prenatal Care

This report includes data on the timing of initiation of prenatal care. It is important to note that this variable is often missing on Pennsylvania birth certificates; in 2014, 13.7% of all birth records lacked this information. However, there has been a decrease in the percentage of missing data compared to 2003, when 40.7% of the birth records were missing this information.

Among those records with available information, 13.3% of women giving birth in 2014 began prenatal care in the third trimester (late) or had no prenatal care at all (Table N12B). The highest percentage of late or no prenatal care in 2014 was among non-Hispanic black women at 16.4%.

#### Geographic Disparities

Birth outcomes by planning district varied widely across the city (Table N13). The highest birth rate was in the North district, and it also had the highest birth rate among teens. West had the highest percentages of low birth weight births and preterm births. Lower Northeast had the highest percentage of women receiving late or no prenatal care.

#### Other Natality Statistics

The Division of Maternal, Child and Family Health will be releasing additional natality-related data, which will be made available at <a href="http://www.phila.gov/health/MCFH/">http://www.phila.gov/health/MCFH/</a>.

# **Mortality Findings**

#### **Mortality Summary**

#### Deaths

There were 13,899 deaths recorded for residents of Philadelphia in 2014, where a resident death is defined as the death of a Philadelphia resident regardless of whether the death occurred within or outside city limits. All mortality data were derived from death certificates, which were registered with the Pennsylvania Department of Health.

There was a 0.5% increase in resident deaths compared to the 13,834 deaths recorded in 2013.

The great majority of deaths in 2014 were due to natural causes (90.4%); 6.0% were accidental, and 1.7% were from homicide.

#### Life Expectancy

In 2014, life expectancy at birth for all Philadelphia males was 73.0 years, a decrease of 0.2 years from 2013. The life expectancy at birth for all Philadelphia females was 79.6 years, an increase of 0.3 years from 2013. Since 2000, life expectancy increased by 4.3 years for men and 3.2 years for women.

- Non-Hispanic Asian women had the longest life expectancy at 92.1 years.
- Non-Hispanic black men had the shortest life expectancy at 70.2 years.
- Life expectancy for all groups improved between 2000 and 2014. Since 2000, the largest increases in life expectancy were among Non-Hispanic Asian women, and Non-Hispanic black men.

#### **Infant Mortality**

There were 174 deaths among Philadelphia babies under 1 year of age in 2014. Overall, infant mortality rate decreased in Philadelphia in 2014 compared to 2013 from 8.2 to 7.8 deaths per 1,000 live births. In 2005, the rate was 11.3 per 1,000 live births.

- There were 116 deaths among babies born to non-Hispanic black women in 2014. This group had an infant mortality rate 2 to 4 times higher than any other race/ethnicity.
- There were 22 deaths among babies born to Hispanic women in 2014, 22 deaths among babies born to non-Hispanic white women, and 6 deaths among babies born to non-Hispanic Asian women.

The leading cause of infant death city-wide was disorders related to short gestation and low birth weight. There were 50 such deaths (28.7% of all infant deaths). The second most common causes were birth defects (congenital malformations, deformations, and chromosomal abnormalities). They resulted in 22 infant deaths.

Between 1960 and 2014, the infant mortality rate dropped from 32.4 to 7.8 deaths per 1,000 live births.

#### **Mortality Trends**

Decreases in mortality between 2000 and 2014 were seen in all the causes studied except accidents (unintentional injuries). The decreases ranged from 5.7% for suicide to 72.0% for HIV/AIDS. The age-adjusted rates for 2000 and 2014 are shown below.

Cause	Rank	Rate	Rate	Percent
	(2014)	2000	2014	Change
All causes		1,085.2	861.9	-20.6%
Heart disease	1	295.5	210.9	-28.6%
Malignant neoplasms	2	249.4	199.9	-19.8%
Accidents (Unintentional injuries)	3	48.3	55.7	+15.3%
Lung cancer	4	70.3	53.9	-23.3%
Cerebrovascular disease	5	68.3	41.9	-38.7%
Chronic lower respiratory disease	6	40.8	35.7	-12.5%
Diabetes	7	27.7	23.4	-15.5%
Nephritis	8	27.2	19.5	-28.3%
Septicemia	9	36.7	18.5	-49.6%
Colorectal cancer	10	28.1	17.6	-37.2%
Breast cancer		19.4	15.3	-21.1%
Influenza and pneumonia		22.4	14.5	-35.3%
Homicide		20.6	14.4	-30.1%
Suicide		10.6	10.0	-5.7%
Prostate cancer		15.1	8.9	-41.1%
HIV/AIDS		18.6	5.2	-72.0%

#### Years of Potential Life Lost (see Technical Notes, p. 222)

In 2014, for all Philadelphia causes of death, years of potential life lost amounted to 9,004 years (Table M7A). Without age-adjustment, the years of potential life lost totaled 136,171 (Table M7B). The causes of death leading to the most life years lost were:

•	Malignant neoplasms	24,407	years
•	Diseases of the heart	22,506	years
•	Accidents (Unintentional injuries)	22,488	years
•	Infant mortality	13,050	years
•	Homicide	9,959	years
•	Lung cancer	5,837	years
•	Suicide	4,726	years

#### Racial-Ethnic Disparities

Although overall mortality rates have generally declined over time, disparities in Philadelphia persisted (Table M8A).

Non-Hispanic black males had the highest rates of death for each cause studied except accidents (unintentional injuries), chronic lower respiratory disease, colorectal cancer, lung cancer, and suicide. Compared to non-Hispanic white males, their rate of death was:

- 12.4 times higher for homicide
- 3.3 times higher for prostate cancer
- 1.5 1.7 times higher for cerebrovascular diseases, diabetes, and kidney disease
- 1.1 1.3 times higher for all cancer, heart disease, septicemia, influenza and pneumonia, and all-cause mortality

Compared to non-Hispanic white females, non-Hispanic black females' rate of death was:

- 2.1 2.2 times higher for diabetes and homicide
- 1.7 times higher for kidney disease
- 1.6 times higher for septicemia
- 1.1 1.4 times higher for all cancers, influenza and pneumonia, heart disease, breast cancer, cerebrovascular diseases, and all-cause mortality

#### Smoking-Attributable Mortality (see Technical Notes, p. 222)

In 2014, tobacco use contributed to the deaths of 3,721 Philadelphians, accounting for 28.3% of all deaths in the city (Figure M10A). There is no significant difference between 2014 and 2013 (3,671 deaths attributed to smoking, accounting for 28.1% of all deaths in the city). Since 2005 age-adjusted rates for deaths due to smoking have decreased 5.9%. The mortality rate for non-Hispanic blacks is higher than for any other major race/ethnicities. Smoking is a risk factor for heart disease, stroke, multiple forms of cancer, and lower respiratory disease. Notably, these estimates do not include deaths to those under 35. Smoking resulted in more than \$1,500 million in productivity losses over the course of the year (Figure M10B).

#### <u>Alcohol-Attributable Mortality</u> (see Technical Notes, p. 222)

Between 2010 and 2014, an annual average of 662 deaths (4.7% of the total deaths) can be attributed to alcohol. While the proportion of deaths due to alcohol consumption for Hispanics (7.8%) is higher than other races/ethnicities, the age-adjusted mortality rate for non-Hispanic Blacks due to alcohol use is the highest among major race/ethnicities (49.3 deaths per 100,000 population). Excessive drinking is also one of the main risks for youths aged 15-19 and 20-24. Nearly one-third of the total deaths among these age groups (31.3% and 31.7% respectively) was due to excessive drinking. Alcohol consumption accounted for more than one-third of the deaths of young non-Hispanic Blacks aged 15-19 and 20-24 (35.1% and 34.9% respectively).

#### Geographic Disparities

Mortality outcomes by planning district followed a general pattern: districts with higher levels of poverty and a greater percentage of racial/ethnic minorities had higher mortality rates. Life expectancy at birth varied from a low of 65.4 years for men in Lower North to a high of 82.1 for women in Upper Far Northeast (Tables M14 – M23).

Lower North, the poorest planning district, had the lowest life expectancy for both men and women, the most homicides for aged 10-24, the second-most homicides for all ages, and the highest rates of:

- All Causes Mortality
- Cerebrovascular diseases
- Heart disease
- Diabetes mortality
- Infant mortality
- Kidney disease
- Septicemia mortality

Lower Far Northeast has the highest mortality rate of colorectal cancers. North had the highest mortality rate of cancers and the most homicides. River Wards had the highest mortality rates of accidents, lung cancer, chronic lower respiratory diseases and smoking-attributable deaths. Upper Northwest had the highest mortality rate of breast cancer. West had the highest mortality rates of influenza and pneumonia, and prostate cancer. West Park had the highest perinatal mortality rate.

## Infant Mortality Rate by Race

Table M5
Infant Mortality Rate by Mother's Race/Ethnicity: 1960 – 2014

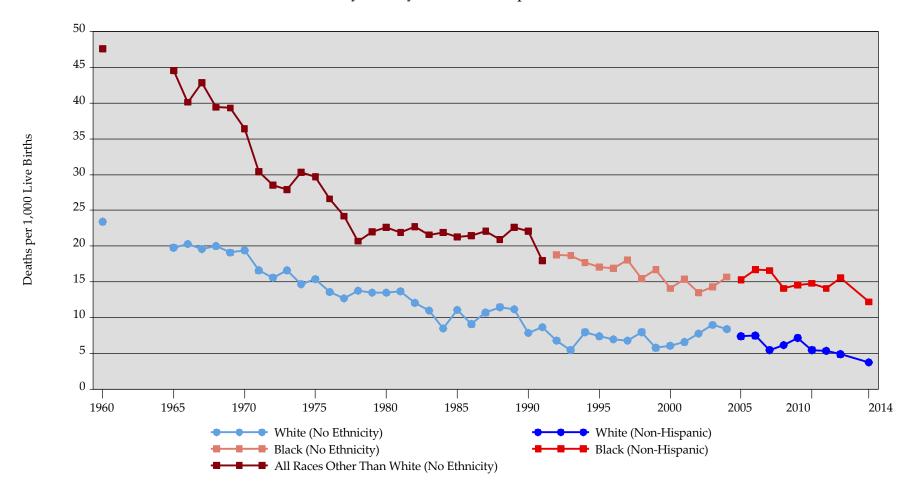

Year	All	White	White	Non-White	Black	Black
Tear	Residents	(All Ethnicities)	(Non-Hispanic)	(All Ethnicities)	(All Ethnicities)	(Non-Hispanic)
1975	22.2	15.4		29.7		
1974	21.9	14.7		30.3		
1973	21.9	16.6		27.9		
1972	21.5	15.6		28.5		
1971	23.0	16.6		30.4		
1970	27.0	19.4		36.4		
1969	27.9	19.1		39.3		
1968	28.3	20.0		39.4		
1967	29.3	19.6		42.8		
1966	28.4	20.3		40.1		
1965	29.7	19.8		44.5		
1964	30.3					
1963	28.9					
1962	30.9					
1961	30.0					
1960	32.4	23.4		47.6		

The values show are death rates per 1,000 live births.

Race/ethnicity classifications have changed over time, and the table has been based on the available data. Other displays in this report show more detailed results available from 2005 on.

Total Deaths	2,128	772	1,155	39	121
Total Alcohol-Attributable Deaths(%) <sup>2</sup>	5.9%	6.3%	5.5%	6.7%	6.5%
65+ Years Old	40.	22 -			9.5
Total Alcohol-Attributable Deaths	182.1	98.5	67.7	5.0	8.0
Total Deaths	9,260	4,895	3,756	153	316
Total Alcohol-Attributable Deaths(%) <sup>2</sup>	2.0%	2.0%	1.8%	3.2%	2.5%

Analysis was based on the methodology implemented by the Centers for Disease Control at  $\,$ 

http://apps.nccd.cdc.gov/DACH\_ARDI. See the technical appendix for more information.

 $<sup>^{1}</sup>$ The rates were expressed as deaths per 100,000 population, which were calculated using Census Population Estimates in July, then adjusted for age with the weight from Census 2000 Standard Population.

<sup>&</sup>lt;sup>2</sup>The percentage was calculated as the proportion of alcohol-attributable deaths to all deaths.

#### **Technical Notes**

#### Determining Philadelphia Residency

Several steps have been followed to identify the birth and death data used in creating this report. The Pennsylvania Department of Health supplies all certificates for individuals whose address is in Philadelphia. The addresses are then filtered to determine whether an address lies within or outside of Philadelphia using a composite geocoder that makes use of a multi-step algorithm based on street address, city, state, and zip code fields. Geocoding the death records includes additional steps to account for more missing and less accurate address data than those available from birth certificates.

#### Race/Ethnicity Categorization

The United States Census Bureau provides estimated populations by many race/ethnic groupings along with many age categories and sex. This report examines results for non-Hispanic whites, non-Hispanic blacks, non-Hispanic Asians, and Hispanics in addition to results for the total population. The total population is larger than the sum of these 4 groups because not everyone fits into these categories. In this report, the population of non-Hispanic whites has been taken from the data for Not Hispanic, White Alone. The same has been done for non-Hispanic blacks and non-Hispanic Asians. This selection avoids double-counting those who consider themselves to belong to more than one of the categories of interest.

In keeping with federal guidelines issued by the National Center for Health Statistics (NCHS), PDPH tabulates birth data by race/ethnicity of the mother. In 2003, Pennsylvania birth certificates employed a new method for recording the race of the mother through the use of a check box format rather than an open-ended question. The Pennsylvania live birth certificate collects both multiple races and a self-designated single race category for the mother. In keeping with the Pennsylvania Department of Health's reporting procedure, the self-designated single race data for mother's race were utilized. These data are combined with the ethnicity designation of Hispanic or not Hispanic to create race/ethnicity categories. Not all birth certificates have this information filled out; in case it is missing, the mother is designated as Other Race/Ethnicity.

#### <u>Maps</u>

The maps created for this report are based on TIGER shapefiles from the Census Bureau and other shape files used internally by the Philadelphia City government. Albers projections have been used.

#### **Population**

The denominators for birth and death rates used in the current report come from the Census Bureau estimates for July 1 of each year (Figure P1). However, the denominators for rates by planning district come from the 2010 census enumeration.

#### Rates

Rates have been expressed on an annual basis as births per 1,000 or deaths per 100,000 estimated population in the specified group. Infant mortality rates are per 1,000 live births. Rates have not been presented when the number of deaths is below 20 or the population is below 5,000 because, in such

cases, a calculated rate may not be reliable or precise. In addition, mortality rates for the Lower South planning district have not been provided as the population is only slightly greater than 5,000.

Rates presented for a particular age band are calculated simply as the number of events divided by the population in the age band. These are crude rates. Age-adjusted rates are used to compare the relative number of events among groups and over time, because the age distribution changes between compared groups. Age-adjusted rates should be viewed as relative indices rather than as actual measures of risk. In this report the age-adjusted rates have been computed by the direct method—that is, by applying the age-specific rates observed this year to the 2000 projected U.S. population, as recommended by the U.S Department of Health and Human Services. We employed statistical approaches adapted from the National Vital Statistics Reports, Volume 57, Number 14, <a href="http://www.cdc.gov/nchs/data/nvsr/nvsr57/nvsr57">http://www.cdc.gov/nchs/data/nvsr/nvsr57/nvsr57</a> 14.pdf. Birth certificates with a missing age for the mother and death certificates with a missing age for the decedent were not included in the calculation of age-adjusted rates. Certificates with an unknown age or sex are not included in tabulations specific to age or sex but are included in overall tabulations.

Using the same projected population, rates for the total population and for each race-sex group were adjusted separately. Age-adjusted rates are not comparable with crude rates.

The infant mortality rate provides the ratio of deaths to live births. When reported for a racial/ethnic classification, the race/ethnicity of deceased infants (numerator) is based on the recorded death file, and the denominator is the total number of live births for that race/ethnicity. In cases where race/ethnicity data may be missing in the death file, the mother's race/ethnicity from the birth file from the PA Department of Health may be consulted.

#### <u>Natality</u>

This report summarizes live births, which per Pennsylvania law refers to the expulsion or extraction from the mother of a product of conception, irrespective of the period of gestation, which shows any evidence of life at any moment after such expulsion or extraction. Fetal deaths are also summarized.

In addition to summaries of births by mother's age, race/ethnicity, and planning district, this report tabulates Philadelphia births by a number of infant characteristics. Among these characteristics is birth weight, which describes the newborn's initial weight after birth, taken preferably within 1 hour after birth before significant post-birth weight loss has occurred. Low birth weight is a weight of less than 2,500 grams (5 pounds 9 ounces). Very low birth weight is a weight of less than 1,500 grams (3 pounds 5 ounces). Another such characteristic is gestational age: preterm births occur at less than 37 weeks of gestation, term births occur between 37 and 41 weeks of gestation, and post-term births at more than 41 weeks of gestation. Also, prenatal care is considered to begin in the first trimester if the first visit happens by 90 days after the last normal menses, in the second trimester if it happens between 91 and 180 days, and in the third trimester if it happens after 180 days. Prenatal care initiation in the third trimester is considered late initiation. Some birth certificates are lacking one or more of these fields. Births which a particular field is missing or unknown were not included in the calculation of the percentage of this field, although they have been counted in the overall summaries. This means that totals do not always correspond between sets of displays.

#### Infant Birth and Death Certificates

Links were made between birth and death certificates only in specific cases of incomplete race/ethnicity data.

#### Causes of Death

The underlying cause of death field from the death certificate is the data item used to tabulate cause of death statistics. The underlying cause is the disease or injury that initiated the train of events leading directly to death or the circumstances of the accident or violence that produced the fatal injury. The Pennsylvania Department of Health codes the cause of death on the death certificate and classifies death by causes according to the International Classification of Diseases, Tenth Revision (ICD-10) of the World Health Organization.

Beginning with the 2005 report, PDPH followed the guidelines issued by the National Center for Health Statistics (NCHS) in the presentation of leading causes of death statistics. The report utilized Instruction Manual Part 9, which provided the lists of causes of death for tabulation and dissemination of mortality data using ICD-10 codes. The tabulation lists have been developed to maintain continuity with the lists from the Ninth Revision of the International Classification of Diseases (ICD-9), to facilitate trend analysis, and to separately identify causes of death that are of public health and medical importance. The use of Instruction Manual Part 9 enables the Philadelphia Department of Public Health to generate mortality statistics comparable to federal statistics as well as keep up-to-date on causes of mortality of public health importance. The causes of death data using the ICD-10 codes were not available prior to 1999.

Of the eight mortality tabulation lists in the Manual, this report utilized two: List of 113 Selected Causes of Death (Table B in Instruction Manual Part 9) and List of 130 Selected Causes of Infant Death (Table C). Table B is used for the general analysis of mortality and for ranking leading causes of death. The rankable causes of death from the list in Table B were utilized to tabulate, rank, and determine leading causes of death statistics. Table C is used for the analysis of infant mortality and for ranking leading causes of infant death. The rankable causes of death from the list in Table C were utilized to tabulate, rank, and determine the leading causes of death.

The leading causes of death are taken from the 10 most frequent causes designated as eligible for ranking in the mortality tabulation lists. The category of "All other causes" of death includes the less frequent eligible causes as well as the ineligible causes.

Age or race/ethnicity was missing for some death certificates. Deaths with missing data have not been counted in detailed displays but are counted in overall displays. This means that totals do not always correspond between sets of displays.

#### Life Expectancy

There are several methods in use for calculating life expectancy, and results at the local level can be influenced by small numbers of deaths, particularly when examining subcategories such as race/ethnic groups and sex as is done in this report. This report follows the methodological options

listed in Life Expectancy at Birth: Methodological Options for Small Populations, National Statistics Methodological Series No. 33, Barbara Toson, Office for National Statistics, 2003. Strata with zero deaths can pose a problem in the intermediate calculations, and that paper suggests a substitution. In this report, the city-wide average for the sex and age has been used. Since life expectancy is lower for infants than for older children, calculations require the population of infants for the denominator. This is available from the finalized Census Bureau data up to the census enumeration 2010. After 2010, the population of infants has been estimated as the difference between births and infant deaths because the majority of these deaths occur quite early.

Life expectancy calculations have been restricted to groups having at least 20 deaths and a population of at least 5,000. Calculations based on smaller numbers may not be reliable or precise. In addition, life expectancy has not been calculated for the Lower South planning district, which has a population only slightly greater than 5,000.

#### Years of Potential Life Lost

Years of potential life lost (YPLL) is a measure of premature mortality, based on estimating the average years a person would have lived if he or she had not died prematurely. The reference age used in this report is 75. For deaths among people under 75, YPLL is calculated by subtracting age at death from 75; for people aged 75 and over, YPLL is set to 0. Total YPLL represents the sum of these individual YPLL estimates.

#### Smoking-Attributable Mortality and Productivity Losses

The analysis of Smoking-Attributable Mortality, Morbidity, and Economic Costs (SAMMEC) follows the updated SAMMEC Methodology listed in the book, <u>The Health Consequences of Smoking - 50 Years of Progress: A Report of the Surgeon General</u>, US Department of Health and Human Services, CDC, 2014. Methodological details are available at the following websites: <a href="http://www.surgeongeneral.gov/library/reports/50-years-of progress">http://www.surgeongeneral.gov/library/reports/50-years-of progress</a>; and <a href="https://chronicadata.cdc.gov/Health-Consequences-and">https://chronicadata.cdc.gov/Health-Consequences-and</a> Costs/Smoking-Attributable Mortality Morbidity-and -Econo/w47j-r23n.

#### Alcohol-Attributable Mortality

The Alcohol-Related Disease Impact (ARDI) methodology is another public health analysis tool developed by the CDC. Given information on the local prevalence of alcohol consumption and counts of deaths due to several causes by age and gender, ARDI can be used to estimate the mortality impact of alcohol consumption. Methodological details can be found at the ARDI website: <a href="http://www.cdc.gov/alcohol/ardi.htm">http://www.cdc.gov/alcohol/ardi.htm</a>.
