INTRODUCTION

Health is influenced by many factors, including social and economic conditions, the built environment, accessibility of healthy products, the behavioral choices people make, and the medical care system. *Health of the City* describes the health and well-being of people who live in Philadelphia. The Philadelphia Department of Public Health produces this annual report to help health care providers, city officials, people who make decisions for non-governmental organizations, and individual residents make more informed decisions about health.

Health of the City includes summaries of data from various sources to describe the demographics of the city’s residents as well as health outcomes and key factors that influence health in five broad areas:

1. **HEALTH OUTCOMES**
   - Represent how healthy Philadelphians are, including measures of quality of life, rates of infectious and chronic illnesses, and premature death.

2. **HEALTH BEHAVIORS**
   - Include behaviors that directly impact health, such as nutrition, exercise, tobacco and drug use, and sexual activity.

3. **CLINICAL CARE**
   - Encompasses both access to and quality of preventive, primary, and acute care.

4. **PHYSICAL ENVIRONMENT**
   - Includes air quality and access to housing and transportation.

5. **SOCIAL AND ECONOMIC DETERMINANTS**
   - Include education, employment, income and community safety.
ABOUT PHILADELPHIA

THE SIXTH LARGEST CITY

Philadelphia is the sixth largest city in the United States (behind New York City, Los Angeles, Chicago, Houston, and Phoenix), with an estimated population of 1,580,863 in 2017. Philadelphia’s young adult population (ages 20 to 34 years) continued to grow and represented the largest portion of the population.

A DIVERSE CITY

Philadelphia is racially and ethnically diverse – 41 percent non-Hispanic black, 35 percent non-Hispanic white, 15 percent Hispanic, and 8 percent Asian. Yet, Philadelphia continued to be segregated along racial lines, with one race or ethnic group representing the majority in 84 percent of the city’s 381 census tracts.

FORTY-EIGHT ZIP CODES AND EIGHTEEN PLANNING DISTRICTS

Philadelphia consists of forty-eight zip codes and eighteen planning districts representing distinct economic, geographic, and social units.
Despite experiencing one of the worst public health crises of our time—the opioid epidemic—most key health indicators in Philadelphia continued to improve over the last year. Yet, some health indicators have moved in the wrong direction and Philadelphia’s health significantly lags behind other major cities. Also, many disparities in key health outcomes and behaviors persist particularly for racial/ethnic minorities and those experiencing poverty. The following sections provide more details.

### SUMMARY HEALTH MEASURES

Measuring life expectancy and examining trends in causes of death show how people are dying, who is dying prematurely and how these deaths may be prevented. After improving for more than a decade, life expectancy in Philadelphia and nationally has started to decline for many groups. Increases in premature mortality due to drug overdoses and homicides are the primary causes. Increases in chronic conditions and other poor health behaviors are likely to further reverse the trend.

² 2017 PA Behavioral Risk Factor Surveillance System
OVERALL MORTALITY

In 2017, an estimated 15,776 Philadelphia residents died. Heart disease, cancer and unintentional injuries were the leading causes of death.

PREMATURE DEATHS

Premature deaths are those that occur before age 75. As many of these deaths may be preventable, estimating the years of potential life lost (YPLL) is a key measure of Philadelphia’s health. From 2000 to 2014 YPLL declined, reaching a low of 9,004 years in 2014. In 2015, this trend reversed and has continued to increase due to increasing deaths from drug overdoses and homicides among young adults.

SUMMARY HEALTH MEASURES

LIFE EXPECTANCY

Similarly, life expectancy at birth in men and women increased until 2014 and declined in recent years. Non-Hispanic Asians had the highest life expectancy overall. Life expectancy at birth was shortest among non-Hispanic black men at 69.1 years.

Life expectancy varies considerably by neighborhood in Philadelphia. Life expectancy was lowest in communities with high rates of adverse behavioral and economic determinants, including poverty, substance use/abuse, and community violence.

SELF-REPORTED HEALTH STATUS

While life expectancy indicates how long people are living, self-reported health status provides a measure of quality of life. Overall, 22 percent of Philadelphians rated their health as poor or fair. There were significant differences among racial/ethnic groups with rates being highest among Hispanics.
Six of the leading causes of death in Philadelphia are related to chronic health conditions: heart disease, cancer, cerebrovascular disease, chronic respiratory disease, diabetes, and chronic kidney disease. These conditions often significantly reduce quality of life and life expectancy, and lead to disability and high health care costs. Many factors, particularly poor health behaviors and lack of access to care, contribute to these conditions, resulting in varying rates among the population.
CHRONIC DISEASES AMONG ADULTS

Children and adults with obesity are at increased risk for developing chronic health conditions like high blood pressure, type 2 diabetes, asthma, and cardiovascular disease. Approximately 1 in 3 adults had obesity, with rates being highest among non-Hispanic blacks. Similar patterns were observed for hypertension among adults. The rate of diabetes remained stable and was highest among non-Hispanic blacks and Hispanics.

CHILDHOOD OBESITY

In 2017, just over 1 in 5 children ages 5 to 18 in public schools had obesity. This high rate of obesity among children undoubtedly contributes to the growing epidemic of obesity among adults. Non-Hispanic black girls and Hispanic boys had the highest rates of obesity. Prevalence of childhood obesity declined slightly over the last decade, but that trend seems to have slowed and potentially reversed in recent years.

PREVALENCE OF DIABETES, HYPERTENSION AND OBESITY AMONG ADULTS

CHRONIC HEALTH CONDITIONS

OBESITY AMONG CHILDREN (AGES 5 – 18)

CHILDHOOD ASTHMA

Asthma is a significant problem for many children in Philadelphia. The rate of asthma-related hospitalizations declined to a low of 58.8 hospitalizations per 10,000 children in 2016. Non-Hispanic black and Hispanic children had the highest rates of asthma-related hospitalizations, 5 to 6 times higher than that of non-Hispanic white children. Rates were also highest among children living in the upper North and West Philadelphia.

SOURCE: 2016 Hospital Discharges, PA Health Care Cost Containment Council
The term “behavioral health” includes conditions related to mental illness, substance use, and emotional well-being. Behavioral health conditions are often associated with disability and premature death. In partnership with the city’s Department of Behavioral Health and Intellectual Disability Services, new indicators related to behavioral health conditions are included in this year’s report.

⁴ 2017 Syndromic Surveillance, PDPH
**DIAGNOSED DEPRESSIVE DISORDER**

In 2017, roughly 1 in 5 adults had a diagnosed depressive disorder, which was nearly double the amount 15 years ago. Rates remained relatively stable in recent years and were highest among Hispanics. These estimates include only diagnosed depressive conditions and may be an underestimate of adults with poor mental health.

**FREQUENT MENTAL STRESS AMONG ADULTS**

Overall health depends on both physical and mental well-being. Mental stress impacts quality of life and has been linked to several physical health conditions, particularly hypertension.
SUICIDE IDEATION AMONG TEENS

Nearly 1 in 7 high school students reported seriously considering suicide in 2017.

SUICIDE DEATHS

Suicide death rates remained fairly stable in Philadelphia, approximately 175 each year. Suicides were most common among non-Hispanic white men.
An opioid epidemic is occurring in Philadelphia and nationwide. This epidemic is largely fueled by years of over prescribing of highly addictive pharmaceutical opioids to treat chronic pain. In 2017, approximately 1 in 3 Philadelphians reported taking a prescription opioid in the last year — rates were high across all age, sex, and racial/ethnic groups.

### OVERDOSE DEATHS

Drug overdose deaths among Philadelphia residents increased nearly 4-fold in recent years. Most drug overdose deaths involve opioids, which include both heroin and pharmaceutical opioids. In 2017, the opioid overdose mortality rate reached a peak of 59.0 deaths per 100,000 people (914 deaths among Philadelphia residents) – 84 percent of these deaths involved fentanyl, a lethal synthetic opioid that has penetrated the illicit drug market.

### OVERDOSE ER VISITS

Fatal drug overdoses are just the tip of the iceberg. Emergency rooms and emergency response units are responding to significant increases of non-fatal drug overdoses. In 2017, there were over 8,000 ER visits for drug overdoses in Philadelphia. However, this is an underestimate of the total non-fatal drug overdoses as many individuals never go to the ER when overdoses are reversed in community settings.
Infectious diseases are spread between people or animals via food, water, air, insects, blood or other bodily fluids. Advances in public health, specifically sanitation, antibiotics, and universal vaccinations, during the twentieth century dramatically reduced illness and deaths related to communicable diseases. With the exception of conditions transmitted via sexual contact and needle sharing, communicable disease incidence rates remain low in Philadelphia.

2. 2017 STD Surveillance, PDPH Division of Disease Control
HIV/AIDS

The number of new HIV diagnoses has declined by nearly half over the last decade. There were an estimated 32.5 new cases per 100,000 people in 2017, representing a slight increase from 2016. Despite significant declines in the number of transmissions due to heterosexual contact, the number of new diagnoses among men who have sex with men (MSM) remained stable and increased among persons who inject drugs. This increase was driven by an outbreak related to the ongoing opioid epidemic in Philadelphia. Overall, rates were nearly 5 times higher in non-Hispanic blacks and Hispanics than non-Hispanic whites and Asians.

In 2016, HIV incidence was highest in Philadelphia compared to other large cities and nationwide.

INFECTIONOUS HEALTH CONDITIONS

CHLAMYDIA AND GONORRHEA

Reported cases of chlamydia and gonorrhea continued to rise. There were 21,066 cases of chlamydia and 7,275 cases of gonorrhea reported in 2017.

Rates of sexually transmitted infections among teens trended downward in recent years. Rates of chlamydia were nearly 5 times higher than gonorrhea among teens. Overall, rates of both gonorrhea and chlamydia were higher in teen girls than boys.

REPORTED CHLAMYDIA AND GONORRHEA CASES | 2008–2017

CHLAMYDIA AND GONORRHEA AMONG PUBLIC HIGH SCHOOL STUDENTS | 2008-2018

SOURCE: 2008-2017 STD Surveillance, PDPH Division of Disease Control
SYPHILIS

The number of syphilis cases per year has increased nearly 5 times since 2004, with over 1000 cases reported in 2017. This resurgence of syphilis infections is largely among young adult men who have sex with men (MSM), who accounted for nearly three-fourths of new cases in 2017.

Health outcomes at birth and during childhood are key indicators of a population’s health. Giving children a healthy start greatly increases their likelihood of good health outcomes as adults.

INFANT DEATHS

After declining for several years, infant (age less than 1) death rates remained stable in recent years in Philadelphia. Non-Hispanic black babies were three times as likely as non-Hispanic white babies to die before their first birthday. Many of these deaths were related to improper sleep positioning and thus preventable.

In 2015, the most recent year with comparable data, infant mortality was higher in Philadelphia than in other large cities and nationwide.

LOW BIRTH WEIGHT

In 2017, approximately 1 out of every 11 babies was born with a low birth weight, less than 2,500 grams. Non-Hispanic black babies were twice as likely to be born at a low birth weight than non-Hispanic white babies. While overall rates remained stable, rates among non-Hispanic blacks rose in recent years.
INFANT AND CHILD HEALTH

PRETERM BIRTH

Rates of premature birth (before 37 weeks of pregnancy) slowly declined in recent years in Philadelphia. Rates of preterm birth were highest among non-Hispanic blacks.

CHILD LEAD EXPOSURE

In 2017, approximately 3.4 percent of tested children (ages 5 and under) had blood lead levels 5-9 μg/dL and 0.8 percent were above 10 μg/dL — all above the CDC-designated “reference level” of 5 μg/dL. Rates of childhood lead exposure are highest among the neighborhoods with high poverty rates and older housing.

For more data on childhood lead poisoning in Philadelphia, please visit http://www.phila.gov/health/childhoodlead/index.html.

SOURCE: 2017 Childhood Lead Surveillance Report, PDPH
NEONATAL ABSTINENCE SYNDROME

Neonatal abstinence syndrome (NAS) is a condition that occurs when newborns are withdrawing from exposure to drugs in the womb. Rates of NAS rose substantially in recent years due to use of both pharmaceutical and illicit opioids. In 2017, the rate of NAS was 13.7 per 1,000 live births, nearly 4 times the rate a decade ago.

SOURCE: 2002-2017 Hospital Discharges, PA Health Care Cost Containment Council

DEVELOPMENTAL DELAYS

Developmental delay in young children can occur in one or many areas – for example, gross or fine motor, language, social or thinking skills – and can have lasting impact on a child’s long-term outcomes.

Developmental delay is most often first detected by physicians using simple screening tools to assess developmental milestones during well child visits during the first three years of life. Delay could be the result of genetic causes, like Down syndrome, complications of pregnancy and birth, like prematurity or NAS, environmental exposures during early years, like lead exposure or infections, or have no identifiable cause. Most children with developmental delay can catch up with specialized early intervention services, which are available to all families in Philadelphia. Based on data from the early intervention programs in Philadelphia, almost 19 percent of children under the age of 6 exhibit some signs of delay in reaching their developmental milestones. While some of these children catch-up without any interventional services, ensuring those with delays are identified and referred to services is critical.
Injuries that result in premature death are broadly categorized into two groups: unintentional (e.g. traffic accidents, poisonings, drug overdoses) and intentional (e.g. homicides, suicides, assaults, etc.). Unintentional injuries as a group are the third leading cause of death overall and the leading cause of death for adults ages 25 to 44 in Philadelphia.

### HOMICIDES

After declining for several years, the homicide mortality rate in Philadelphia increased over the past few years.

### HOMICIDE DEATHS | 2007–2017

![Graph showing homicide death rates from 2007 to 2017](image)

HOMICIDES

The homicide mortality rate was highest among non-Hispanic blacks, nearly ten times higher than non-Hispanic whites and double the rate among Hispanics.
**GUN VIOLENCE**

Over 84 percent of homicides involved a firearm. In addition to the roughly 300 fatal shootings, there were approximately 900 non-fatal shootings in 2017. Shootings clustered in socio-economically disadvantaged neighborhoods.

**PEDESTRIAN AND BICYCLE INJURIES**

Pedestrian and bicycle crashes declined slightly from 2011 to 2017. Rates were highest in Center City, University City, and North Philadelphia areas.

SOURCE: 2017 PA Department of Transportation
HEALTH FACTORS

The Robert Wood Johnson Foundation County Health Rankings presents an index of health at the county level that assigns weights to these health factor types. The largest weights are assigned not to clinical health care, but instead social and economic determinants of health (40 percent) and modifiable health behaviors (30 percent), reflecting a consensus of experts based on extensive research that these factors have the most powerful influence on population health. Similar to the health conditions discussed above, in recent years some risk factors have improved while others persist or have worsened.

Many potentially modifiable factors influence health, including behaviors, accessibility and use of clinical care, social and economic conditions, and the physical environment. Monitoring and addressing these factors is critical to reducing preventable illness and improving the health of Philadelphians.
The CDC recommends four key health behaviors that contribute to a healthy life: no tobacco or drugs, healthy nutrition, regular exercise, and limited alcohol consumption. All of these are associated with lower risk of chronic health conditions, like cardiovascular disease, cancer, and diabetes, which are major causes of death and illness in Philadelphia.

ADULT CIGARETTE SMOKING

In 2017, 23 percent of adults reported current cigarette smoking. While cigarette smoking among adults is slowly declining, Philadelphia continues to have the highest smoking rate among large U.S. cities.

TEEN CIGARETTE SMOKING

Among teens, cigarette smoking declined. In 2017, 3.5 percent of teens reported cigarette smoking and 10.2 percent reported any tobacco use.

ALCOHOL

In 2017, 22 percent of adults and 6.9 percent of teens engaged in at least occasional binge or heavy drinking. Rates of binge drinking have remained stable among adults and declined among teens in recent years.

SWEETENED BEVERAGES

Drinking sugary drinks increases risk of obesity and diabetes. Daily consumption of sugar sweetened beverages declined among teens and adults in recent years. In 2017, the first year of the Philadelphia Beverage Tax implementation, 17.6 percent of teens consumed at least one sugar sweetened beverage daily – down from nearly 22 percent in 2015. Rates were highest among non-Hispanic blacks and Hispanics.

HEALTHY FOOD ACCESS

Often, neighborhoods with high poverty also have lower access to healthy food outlets. Neighborhoods with low walkable access to food and high poverty rates cluster in the North, River Wards and Southwest regions of Philadelphia.

TEEN BIRTHS

High-risk sexual behaviors, particularly among teens, can affect immediate and long-term health. Two key indicators of these high-risk behaviors among teens are condom use and teen births, which are most often unplanned. Teen births continued to decline in 2017. Teen birth rates were highest among Hispanic teens. Reported condom use among teens remained stable at around 55 percent.
Access to high-quality clinical and preventive care is critical to Philadelphians’ health. Access to care largely depends on health insurance coverage, affordability, and adequate availability of healthcare providers and facilities.

INSURANCE COVERAGE

Health insurance coverage has improved significantly for adults and children in Philadelphia. In 2017, 9.7% of adults and 3.6% of children did not have insurance coverage. Insurance coverage among children began improving in 2004 and rates are lower than the national average and other large cities. Rates of uninsured adults declined significantly as Medicaid enrollment increased due to ACA Medicaid expansion. In 2017 approximately 1 in 5 adults ages 18-64 were enrolled in Medicaid.

While more Philadelphians have insurance coverage overall, Hispanic adults have significantly higher uninsured rates compared to other racial/ethnic groups.

COST OF CARE

Paralleling trends in insurance coverage, the percent of adults avoiding care due to cost declined in recent years. In 2017, 13 percent of adults did not seek needed health care because of cost.
ACCESS TO CLINICAL & PREVENTIVE CARE

PRIMARY CARE PHYSICIAN SUPPLY

Overall the availability of primary care providers in Philadelphia has improved. Yet, several clusters of areas in the Northeast, Southwest and parts of South Philadelphia have lower access to primary care. Some of these areas meet the federal criteria as primary care shortage areas. **Approximately 18 percent of adults reported not having a primary care physician.**

For more data on access to primary care in Philadelphia, please visit [link to ATC report].

PREVENTIVE CARE

Immunizations and screenings are critical public health prevention tools. The number of young children in Philadelphia with up-to-date recommended vaccinations has increased over the last decade and has remained stable in recent years.

AMBULATORY CARE SENSITIVE CONDITIONS

When chronic health conditions like asthma, diabetes, and hypertension are managed adequately in primary care settings, patients can avoid many hospitalizations for complications due to these conditions. For this reason, rates of hospitalizations for these “ambulatory care-sensitive conditions”, are used as an indicator of access to and quality of primary care. In Philadelphia, rates of hospitalizations due to these conditions have declined steadily over the last decade. However, in 2016, rates were nearly 2.5 times higher among non-Hispanic blacks and 2 times higher among Hispanics than non-Hispanic whites.

Clean air and water and a safe environment in and out of the home are essential for good health. Unsafe air conditions increase risk of heart disease and exacerbate respiratory conditions like asthma and chronic obstructive pulmonary disease. Unsanitary water can spread infectious illnesses and harmful chemical compounds. Unsafe home conditions can have similar impacts and increase risk for unintentional injuries and create extreme stress for families. Ensuring a safe environment is particularly important for children and seniors.

**AIR QUALITY**

Air quality is summarized by the Air Quality Index (AQI), which combines information about four major air pollutants regulated by the Clean Air Act: ground-level ozone, particle pollution, carbon monoxide, and sulfur dioxide. When the AQI is below 50, it is considered “good” air quality. When the AQI is between 50 and 100, it is considered “moderate” air quality and when it is above 100 the air is considered unhealthy.

The number of days with unhealthy air quality has declined significantly in Philadelphia, while days with good air quality have increased. In 2017, Philadelphians experienced more days with good air quality than in previous years.

**WALKABILITY**

Having walkable neighborhoods encourages active transit and facilitates easy access to jobs, food, and health resources. Philadelphia’s Walk Score®, a summary scoring of walkability to neighborhood resources and amenities, is 79 out of 100. Some areas in the far Northeast, Northwest, and South have walk scores that are significantly lower than the rest of the city.
**PHYSICAL ENVIRONMENT**

**HOUSING WITH POTENTIAL LEAD RISK**

Most Philadelphia homes were built before 1950, and many of those in low income areas have been poorly maintained. Based on age of housing, 42.2 percent of houses in Philadelphia have a potential risk of lead exposure, which is particularly harmful for young children.

**HOUSING CODE VIOLATIONS**

Housing code violations occur when people living in rental properties make complaints to the Department of Licenses and Inspections, which then conducts inspections. The number of housing code violations is a proxy for measuring housing quality in the city, but it is influenced by the staffing levels of the Department of Licenses and Inspections. In 2017, 187.5 violations per 1,000 occupied housing units were issued. Rates are highest in the lowest-income neighborhoods, particularly in North Philadelphia.
Social support, financial resources, education, employment, and stable housing directly impact Philadelphians’ ability to access adequate health care, engage in healthy behaviors, and live in a healthy environment. But these determinants are not addressed in traditional clinical and preventive health care. This section provides data on these social determinants of health in Philadelphia.

SOCIAL AND ECONOMIC DETERMINANTS

POVERTY

In 2017, approximately one-fourth of Philadelphians lived in a household with an income below 100 percent of the federal poverty level. Poverty rates declined in recent years among all racial/ethnic groups except non-Hispanic whites. Increased rates of poverty among non-Hispanic whites are likely related to the ongoing opioid epidemic. Still, Hispanics and non-Hispanic blacks are still about twice as likely to live in poverty as non-Hispanic whites. Poverty is greatest in North and West Philadelphia.

IMPACT OF POVERTY ON HEALTH DISPARITIES

Poverty is the underlying determinant for many of the racial and ethnic health disparities that persist in Philadelphia. Many Philadelphians live, learn, work, shop, and play in high poverty neighborhoods that make good health difficult to achieve. Neighborhoods with high rates of poverty often have lower access to healthy affordable foods, safe outdoor spaces for physical activity, and clinical services, and higher rates of tobacco and alcohol retailers and community violence. These contextual factors in addition to cultural norms often shape health behaviors. Ultimately, they both partially explain poor health and point toward potential solutions.

Living just a couple of miles away can reduce life expectancy by nearly 20 years. Income inequality and life expectancy are directly correlated – that is, neighborhoods with more individuals in the lowest income brackets have significantly lower life expectancy than neighborhoods with more individuals in the highest income bracket. Neighborhoods with higher income gaps are also much more likely to have higher proportions of racial/ethnic minorities.

INCOME INEQUALITY AND LIFE EXPECTANCY

SOCIAL AND ECONOMIC DETERMINANTS

POVERTY AND RACE/ETHNICITY

For many health outcomes and behaviors, higher rates of poverty among non-Hispanic blacks and Hispanics account for much of the disparity. As an illustration, rates of several health outcomes and behaviors are shown below comparing non-Hispanic blacks to non-Hispanic whites by income category. Of note, the white/black disparity is reduced at higher incomes and in many cases no longer present.

UNEMPLOYMENT

Similar to national trends, unemployment has declined significantly in recent years. In 2017, unemployment rates in Philadelphia were higher than other major U.S. cities and the national average.

Unemployment considers employment status among those working and seeking employment. Workforce participation is a measure of employment among all Philadelphians, including the disabled, retired, and those not actively seeking employment. Workforce participation has remained relatively stable since 2000.
EDUCATION

On-time graduation rates increased since 2011, but remained stable in recent years. In 2017, on-time graduation rates were highest among non-Hispanic whites and lowest among Hispanics.

The number of adults completing some college increased over the last decade but has remained stable in recent years. Roughly half of Philadelphians age 25 and older completed at least some college training.

SOCIAL AND ECONOMIC DETERMINANTS

EXCESSIVE HOUSING COST

In 2017, 43.0 percent of Philadelphia households paid 30 percent or more of their income for rental housing. Rates of housing cost-burden have declined in recent years, but remain very high. The highest rates of housing cost burden occur in high poverty neighborhoods in the North, Upper North and Lower Northeast regions of Philadelphia.

HOMELESSNESS

Homelessness is one indicator of housing insecurity among a population. The number of individuals living homeless without shelter in Philadelphia increased significantly over the last few years as a direct result of the opioid epidemic. Individuals with substance use disorder, who are also living homeless, often face barriers accessing temporary housing and shelters due to their dependency.

VIOLENT CRIMES

Violent crimes create unsafe neighborhoods, increase community stress, and may deter healthy behaviors like outdoor exercise. The violent crime rate in Philadelphia decreased over 30 percent from 2007 to 2016.
