Overview of Significant Updates--2018 IRC Codes
Disclaimer

This listing of codes, standards or any other regulations within this presentation is for informational purposes only. They do not constitute the full scope of provisions that may be applicable to your project and cannot be relied upon as evidence of compliance or enforcement.

Any code provision not mentioned in this presentation does not alleviate the person responsible for the design (owner, designer, etc.) from full compliance with necessary codes and standards nor does it diminish the importance of any specific feature or element.
Agenda

- Authority to use new IRC Adoption
- Changes to the 2018 IRC
  - Definitions
  - Building Planning
  - Building Envelope & Ventilation
  - Exterior Decks (Section R507)
  - Photovoltaics & Stationary Storage Battery Stations
  - Energy Conservation
  - Mechanical
PA UCC Regulations and L&I Bulletin B-2202

PA UCC Regulation updates were approved by the IRRC on 1/26/2022, provisions taking effect on date of 2/14/2022 per Section 304(a) (*with a 6-month grace period per Section 304(c)(4) of Act 45 of 1999*).

- **Effective February 14, 2022** the following shall be considered “residential provisions” of the I Codes
  - 2018 IRC – *as amended and including referenced standards*
  - 2018 IECC – *as amended and including referenced standards*
Important dates and time frames for compliance
As is typical with code changes, a “grace period” exists for new accessibility provisions

- **February 14, 2022** – the 2018 provisions go into effect
- **February 14, 2022 – August 14, 2022** – designs can use either the 2015 or 2018 IRC Codes for one- and-two family dwellings
  - If no selection between the two is clearly shown on the construction documents, the Department will enforce 2015 I Codes provisions in accordance with Code Bulletin B-2202
- **August 14, 2022** – the new 2018 IRC provisions are mandatory for compliance
  - No other selection on the construction documents will be accepted
  - Department will enforce 2018 IRC and IECC Codes for one-and-two family dwellings
Significant Changes in the 2018 IRC

Significant changes in the 2018 IRC provisions for discussion purposes

In the following slides we'll go over specific changes deemed significant based on the Department's experience with compliance for One-and-Two family dwellings

- If items require any interpretation, they will be offered as needed. Some items require further review by the Department before final interpretation, if needed, can be offered

- The 2018 IRC and Referenced Amendments can be accessed free at the following links:
  - 2018 International Residential Code (IRC) | ICC Digital Codes (iccsafe.org)
  - PA UCC RAC--2018 I-Codes Adoption Final Report
  - L+I FAQs | Significant Changes between 2015 to 2018 IRC
  - PA Bulletin 52, No. 7 -- 2018 Code Adoption
Definitions

2018 IRC Section R202 Definitions.
New Definitions introduced to include the following:

● Distinctly define CO Alarms from CO Detectors

**[RB]CARBON MONOXIDE ALARM.**
A single- or multiple-station alarm intended to detect carbon monoxide gas and alert occupants by a distinct audible signal. It incorporates a sensor, control components and an alarm notification appliance in a single unit.

**[RB]CARBON MONOXIDE DETECTOR.**
A device with an integral sensor to detect carbon monoxide gas and transmit an alarm signal to a connected alarm control unit.

● Identify “Crawl Space” as NOT as basement

**[RB]CRAWL SPACE.**
An underfloor space that is not a basement.

● Amend “Repair” to be inclusive of replacement workscopes

**[RB]REPAIR.**
The reconstruction, replacement or renewal of any part of an existing building for the purpose of its maintenance or to correct damage.
For the definition applicable in Chapter 11, see Section N1101.6.
2018 IRC CODE UPDATES

BUILDING PLANNING
Building Planning

2018 IRC Section R302.1 Exterior Walls.

Amendments to exceptions for rated exterior walls at accessory structures have been clarified to be applicable only to “individual dwelling units” and their accessory structures.

R302.1 Exterior walls.

Construction, projections, openings and penetrations of exterior walls of dwellings and accessory buildings shall comply with Table R302.1(1); or dwellings equipped throughout with an automatic sprinkler system installed in accordance with Section P2904 shall comply with Table R302.1(2).

Exceptions:

1. Walls, projections, openings or penetrations in walls perpendicular to the line used to determine the fire separation distance.
2. Walls of individual dwelling units and their accessory structures located on the same lot.
2018 IRC Section R302.2 Townhouses.
Amended to clarify requirements for a double wall separation of two (2) 1-hour fire-resistance rated wall assemblies, or the use of common walls under Section R302.2.2, Item 1 & 2.

R302.2 Townhouses.
Walls separating townhouse units shall be constructed in accordance with Section R302.2.1 or R302.2.2.

R302.2.1 Double walls.
Each townhouse shall be separated by two 1-hour fire-resistance-rated wall assemblies tested in accordance with ASTM E119, UL 263 or Section 703.3 of the International Building Code.

R302.2.2 Common walls.
Common walls separating townhouses shall be assigned a fire-resistance rating in accordance with Item 1 or 2. The common wall shared by two townhouses shall be constructed without plumbing or mechanical equipment, ducts or vents in the cavity of the common wall. The wall shall be rated for fire exposure from both sides and shall extend to and be tight against exterior walls and the underside of the roof sheathing. Electrical installations shall be in accordance with Chapters 34 through 43. Penetrations of the membrane of common walls for electrical outlet boxes shall be in accordance with Section R302.4.

1. Where a fire sprinkler system in accordance with Section P2904 is provided, the common wall shall be not less than a 1-hour fire-resistance-rated wall assembly tested in accordance with ASTM E119, UL 263 or Section 703.3 of the International Building Code.

2. Where a fire sprinkler system in accordance with Section P2904 is not provided, the common wall shall be not less than a 2-hour fire-resistance-rated wall assembly tested in accordance with ASTM E119, UL 263 or Section 703.3 of the International Building Code.

• Provisions are still maintained for Common Wall installations in sprinklered and unsprinklered buildings, where plumbing and mechanical equipment is not found in the common wall cavity.
Building Planning

2018 IRC Section R302.5.1 Dwelling-Garage Opening Protective.

The PA UCC RAC amendment removed the 2018 reference to automatic or self-closing door requirements for openings into garages, maintaining the previous 2015 RAC amendments.

R302.5.1 Opening protection. Openings from a private garage directly into a room used for sleeping purposes shall not be permitted. Other openings between the garage and residence shall be equipped with solid wood doors not less than 1-3/8 inches (35 mm) in thickness, solid or honeycomb core steel doors not less than 1-3/8 inches (35 mm) thick, or 20-minute fire-rated doors.
Building Planning

2018 IRC Section R310.1 Emergency Escape & Rescue Openings

Amended to allow for exceptions to any required emergency escape & rescue openings at sleeping rooms located in a basement level, where a sprinklered building per Section P2904 is provided.

- Basement level is required to provide either two (2) means of egress OR one (1) means of egress and one (1) emergency escape and rescue opening.
2018 IRC Section R310.3  Emergency Escape & Rescue Openings – Area Wells

Amendments have replaced reference to “bulkhead enclosures” with “Area Wells” for emergency escape and rescue openings.

- Provisions now provide a “minimum width” for area wells of 36-inches
- Introduces requirements for ladder/step installations for area wells with a vertical depth greater than 44-inches
Building Planning

2018 IRC Section R311.7 Stairs

Amendments around stairs introduced in throughout this section:

- Section R311.7.4 PA UCC RAC Amendments for Winder Tread—Walklines
- Section R311.7.5.3 Amendments mandating a radiused or beveled “nosing” for Treads
- Section R311.7.8 Clarifications for Handrail design requirements regarding handrail projection, clearance, and continuity
- Section R311.11 & R311.12 Exception introduced for the use of Alternative Tread Devices & Ship Ladders where they serve as a means of egress from a small area < 200 SF gross
2018 IRC Section R314.2.2 Smoke Alarms; Where Required—Alterations, Repairs, Additions

Amendments have changed requirements for smoke alarms in existing buildings to be applicable only when such work REQUIRES A PERMIT.

- Previous 2015 language amended to now remove reference to alarm requirements for workscopes adding or creating sleeping rooms, eliminating requirements where living spaces are converted unless a permit is required.

- Note that provisions of the Fire Code, Section F-1103.8 for smoke alarms still govern all existing Group R occupancies, even where no alterations take place.
Building Planning

2018 IRC Section R314.4 Smoke Alarms Interconnections

PA UCC RAC amendments maintains the 2015 IRC exception to Smoke Alarm interconnections for existing buildings undergoing alterations.

- Exception aligns with provisions of the Fire Code, Section F-1108.3.2, Exception 2 for smoke alarm interconnections.
Building Planning

2018 IRC Section R315.2.2 CO Alarms; Where Required—Alterations, Repairs, Additions

Amendments have changed requirements for CO alarms in existing buildings to be applicable only when such work REQUIRES A PERMIT.

- Previous 2015 language amended to now remove reference to alarm requirements for workscopes adding or creating sleeping rooms, eliminating requirements where living spaces are converted unless a permit is required.
- Note that provisions of the Fire Code, Section F-1103.9 for CO alarms still govern all existing sleeping areas and dwelling units, even where no alterations take place.
Building Planning

2018 IRC Section R315.5  CO Alarm Interconnections

Amendment now requires interconnection of CO alarms, similar to provisions for Smoke Alarms.

R315.5 Interconnectivity.
Where more than one carbon monoxide alarm is required to be installed within an individual dwelling unit in accordance with Section R315.3, the alarm devices shall be interconnected in such a manner that the actuation of one alarm will activate all of the alarms in the individual dwelling unit. Physical interconnection of carbon monoxide alarms shall not be required where listed wireless alarms are installed and all alarms sound upon activation of one alarm.

Exception: Interconnection of carbon monoxide alarms in existing areas shall not be required where alterations or repairs do not result in removal of interior wall or ceiling finishes exposing the structure, unless there is an attic, crawl space or basement available that could provide access for interconnection without the removal of interior finishes.
Building Planning

2018 IRC Section R322.3  Flood-Resistant Construction

Amendments have been introduced for structures proposed in Special Flood Hazard Areas for V-Zones and Coastal Zone A developments.

- Section R322.3.4 – Added provisions regarding installation of concrete slabs in Coastal A Zones, which are now required to be Independent structures.

- Section R322.3.7 & R322.3.8 – Added regulations for stairway/ramp and deck/porch installations located in Coastal A Zones.
2018 IRC Section R325.3  Mezzanine – Area Limitations

Introduces new exceptions for larger mezzanine area allowance, without being considered a story, in fully sprinklered buildings

- Exceptions allows for mezzanine sizes up to one-half of the floor area of the room in which they are located in, provided that all conditions of the exception are met

R325.3 Area limitation.  
The aggregate area of a mezzanine or mezzanines shall be not greater than one-third of the floor area of the room or space in which they are located. The enclosed portion of a room shall not be included in a determination of the floor area of the room in which the mezzanine is located.

Exception: The aggregate area of a mezzanine located within a dwelling unit equipped with a fire sprinkler system in accordance with Section P2904 shall not be greater than one-half of the floor area of the room, provided that the mezzanine meets all of the following requirements:

1. Except for enclosed closets and bathrooms, the mezzanine is open to the room in which such mezzanine is located.
2. The opening to the room is unobstructed except for walls not more than 42 inches (1067 mm) in height, columns and posts.
3. The exceptions to Section R325.5 are not applied.
Building Planning

2018 IRC Section R325.5  Mezzanine – Openness

PA UCC RAC Amendments have reduced the maximum wall height conditions governing Mezzanine openness, with removal of exceptions for sprinkler installations

- Maximum wall heights are now reduced to 36-inches, instead of 42-inches
- Exceptions to openness based on sprinkler installations are now removed

R325.5 Openness. Mezzanines shall be open and unobstructed to the room in which they are located except for walls not more than 42 inches (1067 mm) 36 inches (914 mm) in height, columns and posts.

Exceptions:

1. Mezzanines or portions thereof are not required to be open to the room in which they are located, provided that the aggregate floor area of the enclosed space is not greater than 10 percent of the mezzanine area.
2. In buildings that are not more than two stories above grade plane and equipped throughout with an automatic sprinkler system in accordance with NFPA 13R or NFPA 13D, a mezzanine having two or more means of egress shall not be required to be open to the room in which the mezzanine is located.
2018 IRC Section R325.6 Habitable Attics

PA UCC RAC Amendments have relocated the location of the definition for the limits of a “Habitable Attic” to R325, and has removed the 4th condition from the requirements.

R325.6 Habitable attic. A habitable attic shall not be considered a story where complying with all of the following requirements:

1. The occupiable floor area is not less than 70 square feet (17 m²), in accordance with Section R304.
2. The occupiable floor area has a ceiling height in accordance with Section R303.
3. The occupiable space is enclosed by the roof assembly above, knee walls (if applicable) on the sides and the floor-ceiling assembly below.
4. The floor of the occupiable space shall not extend beyond the exterior walls of the floor below.
Building Planning

2018 IRC Section R802, Wood Roof Framing

Various amendments have been made throughout this section for hip & gable roofs:

- Section R802.2, Amended language for connector tie installations to address Roof Thrust
- Section R802.3, Amended language to clarify “framing details” as “ridge” framing scoping, with added provisions around ridge beam requirements

R802.2 Design and construction.
The roof and ceiling assembly shall provide continuous ties across the structure to prevent roof thrust from being applied to the supporting walls. The assembly shall be designed and constructed in accordance with the provisions of this chapter and Figures R606.11(1), R606.11(2) and R606.11(3) or in accordance with AWC NDS.

R802.3 Ridge.
A ridge board used to connect opposing rafters shall be not less than 1 inch (25 mm) nominal thickness and not less in depth than the cut end of the rafter. Where ceiling joist or rafter ties do not provide continuous ties across the structure, a ridge beam shall be provided and supported on each end by a wall or girder.

- Section R802.4, repurposed to apply to “rafter” joists
- Section R802.5, repurposed to apply to “ceiling” joists
- Section R802.5.2, added provisions for ceiling joist-rafter connections
2018 IRC CODE UPDATES

BUILDING ENVELOPE & VENTILATION
2018 IRC Section R405.1, Foundation Drainage

Amended revisions to identify the location of your drainage substrate to be installed at or below the top of the footing, or below the bottom of the slab, to be discharged by gravity or mechanical means.
Building Envelope & Ventilation

2018 IRC Section R408.3, Unvented Crawl Space

PA UCC RAC Amendments have included new provisions to allow for dehumidification in place of ventilation openings in underfloor spaces where sized with the manufacturer’s specifications.

R408.3 Unvented crawl space. Ventilation openings in under-floor spaces specified in Sections R408.1 and R408.2 shall not be required where the following items are provided:

1. Exposed earth is covered with a continuous Class I vapor retarder. Joints of the vapor retarder shall overlap by 6 inches (152 mm) and shall be sealed or taped. The edges of the vapor retarder shall extend not less than 6 inches (152 mm) up the stem wall and shall be attached and sealed to the stem wall or insulation.

2. One of the following is provided for the under-floor space:
   2.1. Continuously operated mechanical exhaust ventilation at a rate equal to 1 cubic foot per minute (0.47 L/s) for each 50 square feet (4.7 m²) of crawl space floor area, including an air pathway to the common area (such as a duct or transfer grille), and perimeter walls insulated in accordance with Section N1102.2.11 of this code.
   2.2. Conditioned air supply sized to deliver at a rate equal to 1 cubic foot per minute (0.47 L/s) for each 50 square feet (4.7 m²) of under-floor area, including a return air pathway to the common area (such as a duct or transfer grille), and perimeter walls insulated in accordance with Section N1102.2.11 of this code.
   2.3. Plenum in existing structures complying with Section M1601.3, if under-floor space is used as a plenum.
   2.4. Dehumidification sized in accordance with manufacturer’s specifications.
Building Envelope & Ventilation

2018 IRC Section R703.1, Exterior Covering; Water Resistance

Amended language for water-resistive barrier location and drainage system requirements from references to “exterior veneer” and exterior “assembly” and clarified as “exterior cladding”

SECTION R703
EXTerior COVERING

R703.1 General.
Exterior walls shall provide the building with a weather-resistant exterior wall envelope. The exterior wall envelope shall include flashing as described in Section R703.4.

Exception: Log walls designed and constructed in accordance with the provisions of ICC 400.

R703.1.1 Water resistance.
The exterior wall envelope shall be designed and constructed in a manner that prevents the accumulation of water within the wall assembly by providing a water-resistant barrier behind the exterior cladding as required by Section R703.2 and a means of draining to the exterior water that penetrates the exterior cladding.
2018 IRC Section R703.7.1, Exterior Plaster (Stucco); Lath

PA UCC RAC Amendments have included language around lath installation requirements, with additional attachment requirements where Exterior Plaster is being specified as the proposed Wall Bracing Method under R602.10.4.

R703.7.1 Lath. Lath and lath attachments shall be of corrosion-resistant materials in accordance with ASTM C1063-2018B. Expanded metal, welded wire, or woven wire lath shall be attached to wood framing members or furring. Where the exterior plaster is serving as wall bracing in accordance with Table R602.10.4, the lath shall be attached directly to framing. The lath shall be attached with 1-1/2-inch-long (38 mm), 11-gauge nails having a 7/16-inch (11.1 mm) head, or 7/8-inch-long (22.2 mm), 16-gauge staples, spaced not more than 7 inches (178 mm) on center along framing members or furring and not more than 24 inches (610 mm) on center between framing members or furring, or as otherwise approved. Additional fastening between wood framing members shall not be prohibited. Lath attachments to cold-formed steel framing or to masonry, stone, or concrete substrates shall be in accordance with ASTM C1063-2018B. Where lath is installed directly over foam sheathing, lath connections shall also be in accordance with Section R703.15, R703.16 or R703.17. Where lath is attached to furring installed over foam sheathing, the furring connections shall be in accordance with Section R703.15, R703.16 or R703.17.

Exception: Lath is not required over masonry, cast-in-place concrete, precast concrete or stone substrates prepared in accordance with ASTM C1063-2018B.

703.7.1.1 Furring. Where provided, furring shall consist of wood furring strips not less than 1 inch by 2 inches (25 mm by 51 mm), minimum 3/8-inch (19 mm) metal channels, or self-furring lath, and shall be installed in accordance with ASTM C1063-2018B. Furring shall be spaced not greater than 24 inches (600 mm) on center and, where installed over wood or cold-formed steel framing, shall be fastened into framing members.
2018 IRC Section R703.7.2, Exterior Plaster (Stucco); Plaster

Amendments now reference applicable ASTM standards associated with exterior plaster applications, provides further guidance on appropriate construction specifications to these exterior covering applications.

**R703.7.2 Plaster.**

Plastering with cement plaster shall be in accordance with ASTM C926. Cement materials shall be in accordance with one of the following:

1. Masonry cement conforming to ASTM C91 Type M, S or N.
2. Portland cement conforming to ASTM C150 Type I, II, or III.
3. Blended hydraulic cement conforming to ASTM C595 Type IP, IS (< 70), IL, or IT (S < 70).
4. Hydraulic cement conforming to ASTM C1157 Type GU, HE, MS, HS, or MH.
5. Plastic (stucco) cement conforming to ASTM C1328.
PA UCC RAC Amendments have now adopted Stucco provisions of the IRC 2021, bringing us up to the latest standard. Significant modification to requirements for drainage layers, with requirements for Dry and Moist/Marine Climates.

2018 IRC Section R703.7.2, Exterior Plaster (Stucco); Water-Resistive Barriers

Water-resistive barriers shall be installed as required in Section R703.2 and, where applied over wood-based sheathing, shall comply with Section R703.7.3.1 or R703.7.3.2.

R703.7.3.1 Dry climates. In Dry (B) climate zones indicated in Figure N1101.7, water-resistive barriers shall comply with one of the following:

1. The water-resistive barrier shall be two layers of 10-minute Grade D paper or have a water resistance equal to or greater than two layers of a water-resistive barrier complying with ASTM E2556-10, Type I. The individual layers shall be installed independently such that each layer provides a separate continuous plane. Flashing installed in accordance with Section R703.4 and intended to drain to the water-resistive barrier shall be directed between the layers.

2. The water-resistive barrier shall be 60-minute Grade D paper or have a water resistance equal to or greater than one layer of a water-resistive barrier complying with ASTM E2556-10, Type II. The water-resistive barrier shall be separated from the stucco by a layer of foam plastic insulating sheathing or other non-water-absorbing layer, or a designed drainage space.

R703.7.3.2 Moist or marine climates. In the Moist (A) or Marine (C) climate zones indicated in Figure N1101.7, water-resistive barriers shall comply with one of the following:
Applications will now be required to comply with provisions under Section R703.7.3.2 for Moist/Marine environments for a drainage layer installation exterior to the WR barrier

1. In addition to complying with Section R703.7.3.1, a space or drainage material not less than 3/16 inch (5 mm) in depth shall be added to the exterior side of the water-resistant barrier.

2. In addition to complying with Section R703.7.3.1, Item 2, drainage on the exterior of the water-resistant barrier shall have a drainage efficiency of not less than 90 percent, as measured in accordance with ASTM E2273-2018 or Annex A2 of ASTM E2925-17.

- **Item 1**: Drainage layer material >= 3/16 inch depth added on the exterior side of the WR Barrier OR;
- **Item 2**: Drainage layer with a drainage efficiency > 90% (per referenced ASTM standards) on exterior side of the WR Barrier
Building Envelope & Ventilation

2018 IRC Section R806.2 Roof Ventilation

PA UCC RAC amends the minimum ventilation area exceptions associated with regard to the installation of mixed ventilation elements to be provided by eave or cornice vents where 40% to 50% of the required ventilating area is provided at the upper portion of the attic or rafter space.

**R806.2 Minimum vent area.** The minimum net free ventilating area shall be 1/150 of the area of the vented space.

**Exception:** The minimum net free ventilation area shall be 1/300 of the vented space provided one or more of the following conditions are met:

1. In Climate Zones 6, 7 and 8, a Class I or II vapor retarder is installed on the warm-in-winter side of the ceiling.
2. Not less than 40 percent and not more than 50 percent of the required ventilating area is provided by ventilators located in the upper portion of the attic or rafter space. Upper ventilators shall be located not more than 3 feet (914 mm) below the ridge or highest point of the space, measured vertically, with the balance of the required ventilation provided by eave or cornice vents. Where the location of wall or roof framing members conflicts with the installation of upper ventilators, installation more than 3 feet (914 mm) below the ridge or highest point of the space shall be permitted.
Building Envelope & Ventilation

2018 IRC Section R806.1 & R806.3  Roof Ventilation—Restricted Obstructions

● Section R806.1 -- PA UCC RAC Amendments remove provisions to require screening in roof ventilation

**R806.1 Ventilation required.** Enclosed attics and enclosed rafter spaces formed where ceilings are applied directly to the underside of roof rafters shall have cross ventilation for each separate space by ventilating openings protected against the entrance of rain or snow. Ventilation openings shall have a least dimension of 1/16 inch (1.6 mm) minimum and 1/4 inch (6.4 mm) maximum. Ventilation openings having a least dimension larger than 1/4 inch (6.4 mm) shall be provided with corrosion-resistant wire cloth screening, hardware cloth, perforated vinyl or similar material with openings having a least dimension of 1/16 inch (1.6 mm) minimum and 1/4 inch (6.4 mm) maximum. Openings in roof framing members shall conform to the requirements of Section R802.7. Required ventilation openings shall open directly to the outside air and shall be protected to prevent the entry of birds, rodents, snakes and other similar creatures.

● Section R806.3 – PA UCC RAC Amendments revises language to prohibit all obstructions for roof ventilation air movement.

**R806.3 Vent and insulation clearance.** Where eave or cornice vents are installed, blocking, bridging and insulation **nothing** shall not block the free flow of air. Not less than a 1-inch (25 mm) space shall be provided between the insulation and the roof sheathing and at the location of the vent.
Building Envelope & Ventilation

2018 IRC Section R806.5 Unvented Attic and Unvented Enclosed Rafter Assemblies

Amendments provide clarification around necessary conditions to be met for attic and enclosed rafter spans to be allowed to be unvented, to include specified location of the air permeable insulation installation.

R806.5 Unvented attic and unvented enclosed rafter assemblies.

Unvented attics and unvented enclosed roof framing assemblies created by ceilings that are applied directly to the underside of the roof framing members and structural roof sheathing applied directly to the top of the roof framing members/rafters, shall be permitted where all the following conditions are met:

1. The unvented attic space is completely within the building thermal envelope.
2. Interior Class I vapor retarders are not installed on the ceiling side (attic floor) of the unvented attic assembly or on the ceiling side of the unvented enclosed roof framing assembly.
3. Where wood shingles or shakes are used, a minimum ¼-inch (6.4 mm) vented airspace separates the shingles or shakes and the roofing underlayment above the structural sheathing.
4. In Climate Zones 5, 6, 7 and 8, any air-impermeable insulation shall be a Class II vapor retarder, or shall have a Class II vapor retarder coating or covering in direct contact with the underside of the insulation.
5. Insulation shall comply with Item 5.3 and either Item 5.1 or 5.2:
   5.1. Item 5.1.1, 5.1.2, 5.1.3 or 5.1.4 shall be met, depending on the air permeability of the insulation directly under the structural roof sheathing.
      5.1.1. Where only air-impermeable insulation is provided, it shall be applied in direct contact with the underside of the structural roof sheathing.
      5.1.2. Where air-permeable insulation is installed directly below the structural sheathing, rigid board or sheet insulation shall be installed directly above the structural roof sheathing in accordance with the R-values in Table R806.5 for condensation control.
Building Envelope & Ventilation

2018 IRC Section R1005.8  Factory Built Chimneys—Insulation Shield
PA UCC RAC Amendment removes provisions introducing requirements for insulation shields in factory built chimney installations.

- Chapter 10 Chimneys and Fireplaces, was adopted without the inclusion of Section R1005.8 Insulation shield
2018 IRC CODE UPDATES

EXTERIOR DECKS
Exterior Decks

2018 IRC Table R507.3.1 Minimum Footing Size for Decks

New addition of prescriptive design tables for exterior deck installations in 2018 IRC.

- Designs based on square and round footing dimensions
- Deck configurations exceeding prescriptive limits should be designed by an engineering analysis per 2018 IRC, Section R301.1.1.

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 pound per square foot = 0.0479 kPa, 1 pound = 0.454 kg.

- No. 1 grade with wet service factor.
- Ground snow load, live load = 40.psf, dead load = 10 psf, Lc, g = 300.
- Ground snow load, live load = 40 psf, dead load = 10 psf, Lc, g = 300 at main span; Lc, g = 100 at cantilever with a 200 pound point load applied to end.
- Includes boring factor.
- Northern species with no nailing factor.
- Cantilever spans not exceeding the nominal depth of the joist are permitted.
Exterior Decks

2018 IRC Table R507.9.1.2  Band Joist Details

Revised language associated with band joist attachment, which now clarifies the intent of the code to allow bearing on a primary structure capable of supporting required loads.

- Previously required to be supported by a wall or sill plate below.

---

**R507.9 Vertical and lateral supports at band joist.**
Vertical and lateral supports for decks shall comply with this section.

**R507.9.1 Vertical supports.**
Vertical loads shall be transferred to band joists with ledgers in accordance with this section.

**R507.8.1.1 Ledger details.**
Deck ledgers shall be a minimum 2-inch by 8-inch (51 mm by 203 mm) nominal, pressure-preservative-treated Southern pine, incised pressure-preservative-treated hem-fir, or approved, naturally durable, No. 2 grade or better lumber. Deck ledgers shall not support concentrated loads from beams or girder. Deck ledgers shall not be supported on stone or masonry veneer.

**R507.8.1.2 Band joist details.**
Band joists supporting a ledger shall be a minimum 2-inch nominal (51 mm), solid-sawn, spruce-pine-fir or better lumber or a minimum 1-inch by 91⁄2-inch (25 mm x 241 mm) dimensional, Douglas fir or better, laminated veneer lumber. Band joists shall bear fully on the primary structure capable of supporting all required loads.

**R507.8.1.3 Ledger to band joist details.**
Fasteners used in deck ledger connections in accordance with Table R507.9.1.3(1) shall be hot-dipped galvanized or stainless steel and shall be installed in accordance with Table R507.9.1.3(2) and Figures R507.9.1.3(1) and R507.9.1.3(2).
2018 IRC CODE UPDATES

PHOTOVOLTAICS & STATIONARY BATTERY STORAGE SYSTEMS
2018 IRC Section R324.3 Photovoltaic Systems—Equipment Listings

Revised language to directly reference NFPA Standard 70, as well as the following UL listings:

- UL 1703 for PV panel and module installations
- UL 1741 for PV inverter installations

R324 Solar energy systems shall comply with the provisions of this section.

R324.2 Solar thermal systems.
Solar thermal systems shall be designed and installed in accordance with Chapter 23.

R324.3 Photovoltaic systems.
Photovoltaic systems shall be designed and installed in accordance with Sections R324.3.1 through R324.7.1, NFPA 70 and the manufacturer’s installation instructions.

R324.3.1 Equipment listings.
Photovoltaic panels and modules shall be listed and labeled in accordance with UL 1703. Inverters shall be listed and labeled in accordance with UL 1741. Systems connected to the utility grid shall use inverters listed for utility interaction.

R324.4 Rooftop-mounted photovoltaic systems.
Rooftop-mounted photovoltaic panel systems installed on or above the roof covering shall be designed and installed in accordance with this section.
2018 IRC Section R324.4.1.1 Rooftop Mounted Photovoltaic Systems—Roof Load

Revised language to clarify Roof Design Load cases to be applied in the design analysis of PV panel installations

- **Load Case 1**: Deadload (inclusive of PV panel weight) and Snowload
- **Load Case 2**: Deadload (exclusive of PV panel weight) and the greater of Roof Live Load or Snow Load

R324.4.1 Structural requirements.
Rooftop-mounted photovoltaic panel systems shall be designed to structurally support the system and withstand applicable gravity loads in accordance with Chapter 3. The roof on which these systems are installed shall be designed and constructed to support the loads imposed by such systems in accordance with Chapter 8.

R324.4.1.1 Roof load.
Portions of roof structures not covered with photovoltaic panel systems shall be designed for dead loads and roof loads in accordance with Sections R301.4 and R301.6. Portions of roof structures covered with photovoltaic panel systems shall be designed for the following load cases:
1. Dead load (including photovoltaic panel weight) plus snow load in accordance with Table R301.2(1).
2. Dead load (excluding photovoltaic panel weight) plus roof live load or snow load, whichever is greater, in accordance with Section R301.8.

R324.4.1.2 Wnd load.
Rooftop-mounted photovoltaic panel or module systems and their supports shall be designed and installed to resist the component and cladding loads specified in Table R301.2(2), adjusted for height and exposure in accordance with Table R301.2(3).

R324.4.2 Fire classification.
Rooftop-mounted photovoltaic panel systems shall have the same fire classification as the roof assembly required in Section R902.

R324.4.3 Roof penetrations.
Rooftop penetrations shall be flashed and sealed in accordance with Chapter 9.
Photovoltaics & Stationary Battery Storage Stations

2018 IRC Section R324.6  Solar Energy Systems—Roof Access & Pathways

NEW added language to provide requirements around pathway requirements around solar energy systems

Roof access and pathways are not required for the following conditions

- Where roof slopes greater than or equal to 2:12 (17% slope)
- Detached, non-habitable structures
- Where code official has determined rooftop operations will not be employed (associated with emergency access/egress)

R324.6 Roof access and pathways.

Roof access, pathways and setback requirements shall be provided in accordance with Sections R324.6.1 through R324.6.2.1. Access and minimum spacing shall be required to provide emergency access to the roof, to provide pathways to specific areas of the roof, provide for smoke ventilation opportunity areas, and to provide emergency egress from the roof.

Exceptions:

1. Detached, nonhabitable structures, including but not limited to detached garages, parking shade structures, carports, solar trellises and similar structures, shall not be required to provide roof access.
2. Roof access, pathways and setbacks need not be provided where the code official has determined that rooftop operations will not be employed.
3. These requirements shall not apply to roofs with slopes of two units vertical in 12 units horizontal (17-percent slope) or less.
2018 IRC Section R324.6 Solar Energy Systems—Roof Access & Pathways (cont’d)

- No fewer than two pathways to be provided on separate roof planes on all buildings
- Required setbacks at horizontal ridge of the roof based on PV array coverage of roof area
- Note clear width requirements for an unobstructed path from emergency escape & rescue openings

R324.6.1 Pathways.
Not fewer than two pathways, on separate roof planes from lowest roof edge to ridge and not less than 36 inches (914 mm) wide, shall be provided on all buildings. Not fewer than one pathway shall be provided on the street or driveway side of the roof. For each roof plane with a photovoltaic array, a pathway not less than 36 inches wide (914 mm) shall be provided from the lowest roof edge to ridge on the same roof plane as the photovoltaic array, on an adjacent roof plane, or straddling the same and adjacent roof planes. Pathways shall be over areas capable of supporting fire fighters accessing the roof. Pathways shall be located in areas with minimal obstructions such as vent pipes, conduit, or mechanical equipment.

R324.6.2 Setback at ridge.
For photovoltaic arrays occupying not more than 33 percent of the plan view total roof area, not less than an 18-inch (457 mm) clear setback is required on both sides of a horizontal ridge. For photovoltaic arrays occupying more than 33 percent of the plan view total roof area, not less than a 36-inch (914 mm) clear setback is required on both sides of a horizontal ridge.

R324.6.2.1 Alternative setback at ridge.
Where an automatic sprinkler system is installed within the dwelling in accordance with NFPA 13D or Section P2504, setbacks at ridges shall comply with one of the following:

1. For photovoltaic arrays occupying not more than 66 percent of the plan view total roof area, not less than an 18-inch (457 mm) clear setback is required on both sides of a horizontal ridge.
2. For photovoltaic arrays occupying more than 66 percent of the plan view total roof area, not less than a 36-inch (914 mm) clear setback is required on both sides of a horizontal ridge.

R324.6.2.2 Emergency escape and rescue opening.
Panels and modules installed on dwellings shall not be placed on the portion of a roof that is below an emergency escape and rescue opening. A pathway not less than 36 inches (914 mm) wide shall be provided to the emergency escape and rescue opening.
Photovoltaics & Stationary Battery Storage Stations

2018 IRC Section R327  Stationary Storage Battery Systems

NEW provisions introduced around stationary storage battery system installations

- Battery systems to be listed with UL 9540
- Not permitted to be installed within habitable spaces of a dwelling unit
- Per R327.5, note ventilation system requirements for compartments to ensure off-gassing of flammable by-products do not accumulate within the structure.
2018 IRC Section R902.4 Rooftop Mounted PV Panel Systems
Amended language to identify requirements for fire classification in accordance with UL 1703 & UL 2703.

- All panel installations located on a roof structure less than 3 ft from a lot line shall be required to be rated with a Class A, B, or C classification rating.

R902.4 Rooftop-mounted photovoltaic panel systems.
Rooftop-mounted photovoltaic panel systems installed on or above the roof covering shall be tested, listed and identified with a fire classification in accordance with UL 1703 and UL 2703. Class A, B or C photovoltaic panel systems and modules shall be installed in jurisdictions designated by law as requiring their use or where the edge of the roof is less than 3 feet (914 mm) from a lot line.
Photovoltaics & Stationary Battery Storage Stations

2018 IRC Section R905.17  Building Integrated PV Panels

NEW provisions governing BIPVs, requiring compliance with NFPA 70

- Note that BIPVs are only permitted on roof slopes greater than or equal to 2:12 (17% slope)
- Roof access & pathway provisions under Section R324.6 are still applicable to BIPV installations

R905.17 Building-integrated Photovoltaic (BIPV) roof panels applied directly to the roof deck.

The installation of *BIPV roof panels* shall comply with the provisions of this section, Section R324 and NFPA 70.

R905.17.1 Deck requirements.

*BIPV roof panels* shall be applied to a solid or closely-fitted deck, except where the roof covering is specifically designed to be applied over spaced sheathing.

R905.17.2 Deck slope.

*BIPV roof panels* shall be used only on roof slopes of two units vertical in 12 units horizontal (17-percent slope) or greater.
2018 IRC CODE UPDATES

ENERGY CONSERVATION
Energy Conservation

2018 IRC Section N1101.4 Above Code Programs

PA UCC RAC amendment maintains the previous 2015 language around Above Code energy efficiency programs, and removes language of the 2018 to require compliance with “Mandatory” provisions of the IECC.

N1101.8 Above code programs. The building official or other authority having jurisdiction shall be permitted to deem a national, state or local energy efficiency program to exceed the energy efficiency required by this chapter. Buildings approved in writing by such an energy efficiency program shall be considered in compliance with this chapter.
Energy Conservation

2018 IRC Table N1102.1.2 Insulation & Fenestration Requirement by Component

PA UCC RAC amendments of the 2018 provisions only affect Zone 3, for a U-Factor value of 0.35. Does not affect Philadelphia, but adoption brings the IRC provisions in line with IECC Residential provisions to a Max U-factor of 0.32.
Energy Conservation

2018 IRC Table N1102.4.1.2 Air Leakage--Testing

- Amendment identifies RESNET/ICC 380 standard as an acceptable air leakage testing method,
- Now establishes a maximum air change per hour rate of 3 ACH for structures designed under the IRC (a change from 5 ACH previously enforced based on PA UCC RAC amendments).

N1102.4.1.2 (R402.4.1.2) Testing.

The building or dwelling unit shall be tested and verified as having an air leakage rate of not exceeding five air changes per hour in Climate Zones 1 and 2, and three air changes per hour in Climate Zones 3 through 8. Testing shall be conducted in accordance with RESNET/ICC 380, ASTM E779 or ASTM E1827 and reported at a pressure of 0.2 inch w.g. (50 Pascals). Where required by the building official, testing shall be conducted by an approved third party. A written report of the results of the test shall be signed by the party conducting the test and provided to the building official. Testing shall be performed at any time after creation of all penetrations of the building thermal envelope.

During testing:

1. Exterior windows and doors, fireplace and stove doors shall be closed, but not sealed, beyond the intended weatherstripping or other infiltration control measures.
2. Dampers including exhaust, intake, makeup air, backdraft and flue dampers shall be closed, but not sealed beyond intended infiltration control measures.
3. Interior doors, where installed at the time of the test, shall be open.
4. Exterior or interior terminations for continuous ventilation systems shall be sealed.
5. Heating and cooling systems, where installed at the time of the test, shall be turned off.
6. Supply and return registers, where installed at the time of the test, shall be fully open.
Energy Conservation

2018 IRC Table N1103.3.3 Duct Testing

Amendment includes additional exception around duct leakage testing associated with ducts serving heat & energy recovery ventilators that are not integrated with ducts serving heating or cooling systems

N1103.3.3 (R403.3.3) Duct testing (Mandatory).

Ducts shall be pressure tested to determine air leakage by one of the following methods:

1. Rough-in test: Total leakage shall be measured with a pressure differential of 0.1 inch w.g. (25 Pa) across the system, including the manufacturer’s air handler enclosure if installed at the time of the test. Registers shall be taped or otherwise sealed during the test.

2. Postconstruction test: Total leakage shall be measured with a pressure differential of 0.1 inch w.g. (25 Pa) across the entire system, including the manufacturer’s air handler enclosure. Registers shall be taped or otherwise sealed during the test.

Exceptions:

1. A duct air-leakage test shall not be required where the ducts and air handlers are located entirely within the building thermal envelope.

2. A duct air-leakage test shall not be required for ducts serving heat or energy recovery ventilators that are not integrated with ducts serving heating or cooling systems.

A written report of the results of the test shall be signed by the party conducting the test and provided to the building official.
Energy Conservation

2018 IRC Table N1103.3.5 Ducts—Building Cavities
PA UCC RAC amendment maintains the previous 2015 language, effectively maintaining allowance of building framing to serve as return plenums but not supply air ducts.

\[ N1103.3.5 \text{(R403.3.5)} \text{Building cavities (Mandatory). Building framing cavities shall not be used as supply ducts.} \]
Energy Conservation

2018 IRC Table N1103.3.6 Ducts Buried within Ceiling Insulation
New added provision introduces regulations around ducts buried within ceiling insulation,

- Duct insulation value of R-8 to be installed, OR
- Sum of ceiling insulation against and above the top of duct, and against and below the bottom of the duct, shall be not less than R-19

Provisions under N1103.3.6.1 provide prescriptive means to determine effective insulation rating for ducts deeply buried within ceiling insulation

2018 IRC Table N1103.3.7 Ducts Located inside Conditioned Space
New added provision clarifies conditions under which a duct can be considered “inside a conditioned space”
Energy Conservation—Simulated Performance Method

2018 IRC Section N1105.1 Scope
Amendment provides clarification of mechanical ventilation analysis to be included within the Performance Compliance path energy usage.

SECTION N1105 (R405)
SIMULATED PERFORMANCE ALTERNATIVE (PERFORMANCE)

N1105.1 (R405.1) Scope.
This section establishes criteria for compliance using simulated energy performance analysis. Such analysis shall include heating, cooling, mechanical ventilation and service water heating energy only.
Energy Conservation—Simulated Performance Method

2018 IRC Section N1105.4.2 Compliance Report

PA UCC RAC Amendments maintains previous 2015 provisions, removing any 2018 reference to the allowance of batch sampling for final compliance reports. Amendment effectively requires each building to be provided with their own Final Compliance report.

\textit{N1105.4.2 (R105.4.2) Compliance report.} Compliance software tools shall generate a report that documents that the proposed design complies with Section N1105.3. A compliance report on the proposed design shall be submitted with the application for the building permit. Upon completion of the building, a compliance report based on the as-built condition of the building shall be submitted to the code official before a certificate of occupancy is issued. Batch sampling of buildings to determine energy code compliance for all buildings in the batch shall be prohibited.
Energy Conservation—Simulated Performance Method

2018 IRC Table N1105.5.2(1) Specifications for Standard Reference and Proposed Designs

Amended revisions to the Standard Reference Design for Mechanical Ventilation & Thermal Distribution Systems

- **Mechanical Ventilation**—Revision to the calculation of energy usage related to mechanical ventilation within the Standard Reference design

  - Where mechanical ventilation is not specified in the proposed design: None
  - Where mechanical ventilation is specified in the proposed design, the annual vent fan energy use, in units of kWh/yr, shall equal \( (1/\eta_v) \times [0.0875 \times \text{CFA} + 65.7 \times (N_v+1)] \)
  - where:
    - \( \eta_v \) = the minimum exhaust fan efficacy, as specified in Table R403.6.1, corresponding to a flow rate of 0.01 \( \times \) CFA + 7.5 \( \times \) (\( N_v \)+1)
    - CFA = conditioned floor area, ft\(^2\).

- **Thermal Distribution System**—Added exception associated with non-ducted heating and cooling systems that do not have a fan
Energy Conservation—Energy Rating Index

2018 IRC Section N1106.3 Energy Rating Index

PA UCC RAC Amendments maintains allowance from the 2015 IRC and allows for minimum requirement in the 2006 IRC to be utilized as the basis of design compliance. This code amendment will allow for less efficient ERI buildings than previously allowed.

**N1106.3 (R406.3) Energy rating index.** The Energy Rating Index (ERI) shall be a numerical integer value that is based on a linear scale constructed such that the ERI reference design has an Index value of 100 and a residential building that uses no net purchased energy has an Index value of 0. Each integer value on the scale shall represent a 1 percent change in the total energy use of the rated design relative to the total energy use of the ERI reference design. The ERI shall consider all energy used in the residential building.

**N1106.3.1 (R406.3.1) ERI reference design.** The ERI reference design shall be configured such that it meets the minimum requirements of the 2006 International Energy Conservation Code prescriptive requirements. The proposed residential building shall be shown to have an annual total normalized modified load less than or equal to the annual total loads of the ERI reference design.
Energy Conservation—Energy Rating Index

2018 IRC Section N1106.4 ERI-based Compliance

Amendment increases the amount of energy the final design can use by allowing a higher ERI, allowing a less stringent design than the previous 2015 edition.

N1106.4 (R406.4) ERI-based compliance.

Compliance based on an ERI analysis requires that the rated design be shown to have an ERI less than or equal to the appropriate value indicated in Table N1106.4 when compared to the ERI reference design.

• Includes additional footnote for consideration of on-site renewables for ERI analysis, which will still require the design to comply with mandatory minimum building envelope requirements of the 2015 standard.

*Includes additional footnote for consideration of on-site renewables for ERI analysis, which will still require the design to comply with mandatory minimum building envelope requirements of the 2015 standard.
Energy Conservation—Energy Rating Index

2018 IRC Section N1106.7 Calculation Tools

PA UCC RAC Amendment maintains the 2015 IRC text regarding ERI Compliance software requirements, removing reference to the RESNET/ICC 301 standard.

N1106.7 (R406.7) Calculation software tools. Calculation software, when used, shall be in accordance with Sections N1106.7.1 through N1106.7.3.

N1106.7.1 (R406.7.1) Minimum capabilities. Calculation procedures used to comply with this section shall be software tools capable of calculating the ERI as described in Section N1106.3, and shall include the following capabilities:

1. Computer generation of the ERI reference design using only the input for the rated design.

The calculation procedure shall not allow the user to directly modify the building component characteristics of the ERI reference design.

- Section N1106.7.2 will allow for a jurisdiction to approve of any specified analysis tools used for ERI analysis, which can include RESNET/ICC 301 if employed.
Energy Conservation—Alterations

2018 IRC Section N1109.1.2 Alterations; Heating and Cooling Systems

PA UCC RAC Amendment maintains the 2015 IRC text regarding alterations for heating and cooling systems

- Effectively mandating selective compliance for new heating, cooling and duct systems when such new work is part of an alterations workscope (whereas 2018 IRC provisions would mandate full compliance).

\[N1109.1.2 \text{ (R503.1.2) Heating and cooling systems.} \text{ New heating, cooling and duct systems that are part of the alteration shall comply with Sections N1103.1, N1103.2, N1103.3 and N1103.6.}\]

**Exception:** Where ducts from an existing heating and cooling system are extended, duct systems with less than 40 linear feet (12.19 m) in unconditioned spaces shall not be required to be tested in accordance with Section N1103.3.3.
2018 IRC CODE UPDATES

MECHANICAL
Mechanical

2018 IRC Section M1503  Domestic Cooking Exhaust Equipment

Extensive amendments to provisions for domestic cooking exhaust equipment installations, to include

- Section M1503.2 -- Includes new specified hood equipment listings
- Section M1503.2.1 – Provisions for Open-Top Broiler Exhaust requirements
- Section M1503.6 – Make-up Air Requirements for equipment without direct venting or mechanical draft for any equipment capable of exhausting in excess of 400 CFM

M1503.6 Makeup air required.

Where one or more gas, liquid or solid fuel-burning appliance that is neither direct-vent nor uses a mechanical draft venting system is located within a dwelling unit's air barrier, each exhaust system capable of exhausting in excess of 400 cubic feet per minute (0.19 m³/s) shall be mechanically or passively provided with makeup air at a rate approximately equal to the exhaust air rate. Such makeup air systems shall be equipped with not fewer than one damper complying with Section M1503.6.2.
Mechanical

2018 IRC Section M1505.4.3 Mechanical Ventilation Rate

Amendment introduces a new method for determining whole-house mechanical ventilation rates based on a calculation. Provisions still maintain the prescriptive table for designers.

M1505.4.3 Mechanical ventilation rate.

The whole-house mechanical ventilation system shall provide outdoor air at a continuous rate as determined in accordance with Table M1505.4.3(1) or Equation 15-1.

Ventilation rate in cubic feet per minute = (0.01 × total square foot area of house) + [7.5 × (number of bedrooms + 1)]

Equation 15-1
